

Package ‘npde’

April 7, 2021

Title Normalised Prediction Distribution Errors for Nonlinear Mixed-Effect Models

Version 3.1

Date 2021-04-07

Maintainer Emmanuelle Comets <emmanuelle.comets@inserm.fr>

Description

Provides routines to compute normalised prediction distribution errors, a metric designed to evaluate non-linear mixed effect models such as those used in pharmacokinetics and pharmacodynamics. Documentation about 'npde' is provided by a comprehensive user guide on the github repository (<https://github.com/ecomets/npde30/blob/main/userguide_npde_3.0.pdf>), and references concerning the methods include the papers by Brendel et al. (2006, <doi:10.1007/s11095-006-9067-5>; 2010, <doi:10.1007/s10928-009-9143-7>), Comets et al. (2008, <doi:10.1016/j.cmpb.2007.12.002> ; 2010, <<http://journal-sfds.fr/article/view/45>>), and Nguyen et al. (2012, <doi:10.1007/s10928-012-9264-2>). See 'citation("npde")' for details.

PDF documentation for npde 3.0: https://github.com/ecomets/npde30/blob/main/userguide_npde_3.0.pdf

Examples

```
data(theopp)
data(simtheopp)

# Calling autonpde with dataframes

x<-autonpde(theopp,simtheopp,ix="Time",iy="Conc",iid="ID",boolsave=FALSE)
print(x)
```

autonpde

Compute normalised prediction distribution errors

Description

These functions compute normalised prediction distribution errors (npde) and prediction discrepancies (pd). npde asks the user the name and structure of the files containing the data, using pdmenu, while autonpde takes these variables and others as arguments.

Usage

```
autonpde(namobs, namsim, iid, ix, iy, imdv = 0, icens = 0,
icov = 0, iipred = 0, boolsave = TRUE, namsav = "output", type.graph = "eps",
verbose = FALSE, calc.npde=TRUE, calc.npd=TRUE, decorr.method = "cholesky",
cens.method = "cdf", units = list(x="",y=""), detect=FALSE, ties=TRUE, header=TRUE)
```

```
npde()
```

```
npde()
```

Arguments

| | |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namobs | name of the file containing the observed data, or a dataframe containing the observed data (in both cases, the column containing the various data required for the computation of the pde can be set using the arguments iid,ix and iy below) |
| namsim | name of the file containing the simulated data, or a dataframe containing the simulated data (the program will assume that subject ID are in column 1 and simulated Y in column 3, see User Guide) |
| iid | name/number of the column in the observed data containing the patient ID; if missing, the program will attempt to detect a column named id |
| ix | name/number of the column in the observed data containing the independent variable (X); ; if missing, the program will attempt to detect a column named X |
| iy | name/number of the column in the observed data containing the dependent variable (Y); if missing, the program will attempt to detect a column with the response |
| imdv | name/number of the column containing information about missing data (MDV), defaults to 0 (column not present) |
| icens | name/number of the column containing information about censored data (cens), defaults to 0 (column not present) |
| icov | name/number of the column(s) containing covariate information defaults to 0 (no covariates) |
| iipred | name/number of the column(s) with individual predictions (ipred), defaults to 0 (individual predictions not available) |

| | |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>boolsave</code> | a boolean (TRUE if graphs and results are to be saved to a file, FALSE otherwise), defaults to TRUE |
| <code>namsav</code> | name of the files to which results are to be saved (defaults to "output", which will produce a file called output.eps (if the default format of postscript is kept, see <code>type.graph</code>) for the graphs and a file called output.npde for the numerical results (see value) |
| <code>type.graph</code> | type of graph (one of "eps", "jpeg", "png", "pdf"), defaults to postscript ("eps") |
| <code>verbose</code> | a boolean (TRUE if messages are to be printed as each subject is processed, FALSE otherwise), defaults to FALSE |
| <code>calc.npde</code> | a boolean (TRUE if npde are to be computed, FALSE otherwise), defaults to TRUE |
| <code>calc.npd</code> | a boolean (TRUE if npd are to be computed, FALSE otherwise), defaults to TRUE |
| <code>decorr.method</code> | a character string indicating the method used to decorrelate observed and simulated data in the computation of npde (see npde.decorr.method) defaults to cholesky |
| <code>cens.method</code> | a character string indicating the method used to handle censored data (see npde.cens.method) defaults to cdf |
| <code>units</code> | a list with components x, y and cov (optional), specifying the units respectively for the predictor (x), the response (y), and the covariates (a vector of length equal to the number of covariates). Units will default to (-) if not given. |
| <code>detect</code> | a boolean controlling whether automatic recognition of columns in the dataset is on, defaults to FALSE |
| <code>ties</code> | a boolean (if FALSE, the distributions of pd and npde are smoothed by jittering the values so that there are no ties), defaults to TRUE |
| <code>header</code> | a boolean (TRUE if input files have headers, FALSE otherwise), defaults to TRUE |

Details

Both functions compute the normalised prediction distribution errors (and/or prediction discrepancies) in the same way. `npde` is an interactive function whereas `autonpde` takes all required input as arguments.

Diagnostic graphs are produced for `npd`, and `npde` are used in the tests as their distribution takes into account the correlation between repeated observations.

When the computation of `npde` fails because of numerical problems, error messages are printed out, then `pd` are computed instead and graphs of `pd` are plotted so that the user may evaluate why the computation failed.

The function also prints out the characteristics of the distribution of the `npde` (mean, variance, skewness and kurtosis) as well as the results of the statistical tests applied to `npde`. In addition, if `boolsave` is TRUE, two files are created:

results file the numerical results are saved in a file with extension `.npde` (the name of which is given by the user). The file contains the components `id`, `xobs`, `ypred`, `npde`, `pd` stored in columns

graph file the graphs are saved to a file with the same name as the results file, and with extension depending on the format.

Value

An object of class `NpdeObject`

Author(s)

Emmanuelle Comets <emmanuelle.comets@bichat.inserm.fr>

`npde.graphs`, `gof.test`

Examples

```
data(theopp)
data(simtheopp)

# Calling autonpde with dataframes
x<-autonpde(theopp,simtheopp,1,3,4,boolsave=FALSE)
x
head(x["results"]["res"])

plot(x)
```

dist.pred.sim

Compute distribution of pd/npde using simulations

Description

This function is used to build the distribution of pd/npde using the simulations under the model. The default is to build only the distribution of pd, and to sample from $N(0,1)$ when building the distribution of npde under the null hypothesis.

Usage

```
dist.pred.sim(npdeObject, nsamp, ...)
```

Arguments

| | |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| nsamp | number of datasets (defaults to 100 or to the number of replications if it is smaller) |
| ... | additional arguments. Currently only the value of calc.npd and calc.npde may be passed on, and will override their corresponding value in the "options" slot of npdeObject |

Value

an object of class NpdeObject; the ["results"] slot will contain pd and/or npde for a sample of the simulated datasets (depending on whether calc.npd/calc.npde are set), stored in pd.sim and/or npde.sim

See Also

[npde](#), [autonpde](#)

Examples

```
data(theopp)
data(simtheopp)
x<-autonpde(theopp,simtheopp,1,3,4,boolsave=FALSE)
# Use random samples from N(0,1) to obtain a prediction interval on the empirical cdf of the npde
plot(x,plot.type="ecdf",bands=TRUE,approx.pi=TRUE)
# defaults to computing the pd and npde for 100 simulated datasets
# (in the theophylline example, this uses all the simulated datasets)
x<-dist.pred.sim(x)
# Use the npde from the simulated datasets to obtain a prediction interval on the empirical cdf
plot(x,plot.type="ecdf",bands=TRUE,approx.pi=FALSE)
```

gof.test

*Goodness-of-fit tests for npde***Description**

Performs test on the selected variable (which=one of npde, pd or npd) or on a numeric vector

Usage

```
gof.test(object, parametric = TRUE, ...)
```

```
printgofest(object, which = "npde", ...)
```

Arguments

| | |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object | an object (currently has methods for types numeric, NpdeRes and NpdeObject) |
| parametric | a boolean. If TRUE (default), parametric tests are performed |
| ... | additional arguments passed on to the function; special arguments are <code>na.action</code> , which controls how to handle NAs in the results (<code>na.action</code>), <code>verbose</code> (if FALSE, suppresses printing of the results) and <code>covsplit</code> which requests the tests to be performed split by categories or quantiles of the data. If <code>covsplit</code> is TRUE, continuous covariates will be split in 3 categories (<Q1, Q1-Q3, >Q3) (see details in the PDF documentation), but this behaviour can be overridden by passing the argument <code>ncat=XXX</code> where XXX is the number of categories to divide the continuous covariates in. |
| which | character string giving (used by printgofest) |

Details

If object is an NpdeObject and an argument `covsplit=TRUE` is given in ..., in addition to the global descriptive statistics and tests, tests will be performed for each covariate in `which.cov`. This argument can be set in ...; barring an explicit specification, the component `which.cov` of the `prefs` slot for a NpdeObject object will be used. The default value is `which.cov="all"`, which produces tests for each covariate in the dataset. Two additional dataframes will then be present:

cov.stat descriptive statistics and test p-values split by covariate and by categories

cov.p.value p-values split by covariate; for each covariate, two tests are performed: the first test is a correlation test for continuous covariates and a Chi-square test for categorical covariates; the second test is defined using the p-values of the global tests split by each category, and applying a Bonferroni correction to obtain an overall p-value (see PDF documentation for details)

The `p.value` elements is a named vector with four components:

p.mean p-value for the mean test (Wilcoxon test if `parametric=FALSE`, Student test if `parametric=TRUE`)

p.var p-value for the variance test (`parametric=FALSE`, Fisher test if `parametric=TRUE`)

p.dist p-value for the distribution test (Shapiro-test for normality (npd, npde)/Kolmogorove-Smirnov test for uniformity)

p.global p-value for the global test (combination of the mean, variance and distribution tests with a Bonferroni correction)

The p-values are adjusted using a Bonferroni correction: the raw p-values of the 3 individual tests are multiplied by 3, and the p-value for the global test is equal to the minimum of the adjusted p-values.

Value

A list with the following elements:

mean mean

se.mean standard error of the mean

var variance

se.var standard error on variance

kurtosis kurtosis (see [kurtosis](#))

skewness skewness (see [skewness](#))

p.value p-values for several tests (see below)

[kurtosis](#), [skewness](#)

Examples

```
data(theopp)
data(simtheopp)
#' # Calling autonpde with dataframes
x<-autonpde(theopp,simtheopp,1,3,4,boolsave=FALSE)
gof.test(x)
```

`kurtosis`*Kurtosis*

Description

Computes the kurtosis.

Usage

```
kurtosis(x)
```

Arguments

`x` a numeric vector containing the values whose kurtosis is to be computed. NA values are removed in the computation.

Details

If $N = \text{length}(x)$, then the kurtosis of x is defined as:

$$N \frac{\text{sum}_i(x_i - \text{mean}(x))^4}{(\text{sum}_i(x_i - \text{mean}(x))^2)^2} - 3$$

3

Value

The kurtosis of `x`.

References

Examples

```
x <- rnorm(100)
kurtosis(x)
```

npde.cens.method *Method used to handle censored data*

Description

Specifies the method used to handle censored data (data below the limit of quantification LOQ)

Details

Several methods are available to handle censored data.

omit pd and npde for censored data will be set to NA

cdf for an observation `ycens_ij` under the LOQ, a `pd_ij` will be imputed in the uniform distribution $[0-pLOQ_{ij}]$ where $pLOQ_{ij}$ is the probability that y_{ij} is below LOQ, according to the model; the predictive distribution will then be used to obtain a corresponding y^*_{ij} . This is also performed for all simulated data, and the npde are then computed on the completed dataset containing the observed y_{ij} for the uncensored data and the y^*_{ij} imputed for the censored data. This method is the default.

ipred an observation `ycens_ij` is replaced by the individual prediction according to the model (`ipred`, which must be present in the dataset). Simulated data are left untouched.

ppred an observation `ycens_ij` is replaced by the population prediction according to the model. Simulated data are left untouched.

loq an observation `ycens_ij` is replaced by the value of the LOQ. Simulated data are left untouched.

Value

This is not a function and does not have a return value, this is a statistical method.

More details can be found in the PDF documentation.

Examples

```
data(warfarin)
data(simwarfarinCov)
wcov<-autonpde(namobs=warfarin,namsim=simwarfarinCov, iid=1,ix=2,iy=4,icov=c(3,6:8),
namsav="warfCov", units=list(x="hr",y="mg/L", covariates=c("mg","kg","-", "yr")))

# Diagnostic plots for warfarin with a covariate model
plot(wcov)

# Covariate plots
```

```

xwt.scatt<-plot(wcov, plot.type="x.scatter", covsplit=TRUE, which.cov="wt")
xwt.qqplot<-plot(wcov, plot.type="qqplot", covsplit=TRUE, which.cov="wt")
xwt.box<-plot(wcov, plot.type="covariates", which.cov="wt")
xsex.scatt<-plot(wcov, plot.type="x.scatter", covsplit=TRUE, which.cov="sex")
xsex.qqplot<-plot(wcov, plot.type="qqplot", covsplit=TRUE, which.cov="sex")
xsex.box<-plot(wcov, plot.type="covariates", which.cov="sex")

# Transforming the reference profile for npd, compared to a VPC plot
plot.tnpd<-plot(wcov, plot.type="x.scatter", ref.prof=list(id=2),
main="tnpd with reference profile ID=2")
plot.vpc<-plot(wcov, plot.type="vpc", main="VPC")
grid.arrange(grobs=list(plot.tnpd, plot.vpc), nrow=1, ncol=2)

```

npde.decorr.method *Decorrelation methods in npde*

Description

Specifies the method used to decorrelate observed and simulated data

Arguments

x a square matrix

cholesky decorrelation is performed through the Cholesky decomposition (default)

inverse decorrelation is performed by inverting V_i through the eigen function

polar the singular-value decomposition (svd) is used

@return This is not a function and does not have a return value, this is a statistical method.

Details

More details can be found in the PDF documentation.

References

K. Brendel, E. Comets, C. Laffont, C. Laveille, and F. Mentre. Metrics for external model evaluation with an application to the population pharmacokinetics of gliclazide. *Pharmaceutical Research*, 23:2036–49, 2006.

npde.graphs *Save the graphs for a NpdeObject object to a file*

Description

Save the graphs to a file on disk

Usage

```
npde.graphs(object, ...)
```

Arguments

| | |
|--------|-------------------------------------------------|
| object | a NpdeObject object |
| ... | optional arguments to replace options in object |

Details

The following options can be changed by passing the appropriate arguments: namsav (string giving the root name of the files, an extension depending on the type of graph will be added), namgr (string giving the full name of the file), type.graph (one of "eps", "pdf", "jpeg", "png")

Value

No return value, called for side effects

References

K. Brendel, E. Comets, C. Laffont, C. Laveille, and F.Mentre. Metrics for external model evaluation with an application to the population pharmacokinetics of gliclazide. *Pharmaceutical Research*, 23:2036–49, 2006.

npde.plot.covariate *Covariate diagnostic plots*

Description

Boxplot of the selected variable versus categories of covariates

Usage

```
npde.plot.covariate(npdeObject, which.y="npd", ...)
```

Arguments

| | |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| which.y | a string specifying the variable on the Y-axis (one of "yobs", "npde", "pd", "npd") |
| ... | additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as set.plotoptions and npdeControl) |

Details

For a categorical covariate, boxplots are produced for each category. Continuous covariates are split into quantile (by default, first quartile (<Q1), interquartile range (Q1-Q3) and upper quartile (>Q3), but the number of categories can be set by using the ncat argument).

For each category, the median according to simulations under the model is shown (it can be suppressed by using the argument bands=FALSE)..

Value

a ggplot object or a list of ggplot objects (grobs)

| | |
|----------------|-------------------------------|
| npde.plot.data | <i>Plot a NpdeData object</i> |
|----------------|-------------------------------|

Description

Produces a spaghetti plot of the data

Usage

```
npde.plot.data(npdeObject, ...)
```

Arguments

| | |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| ... | additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as set.plotoptions) |

Value

a ggplot object or a list of ggplot objects (grobs)

npde.plot.default *Diagnostic plots*

Description

The default diagnostic plots produced after a call to [npde](#) or [autonpde](#) include a histogram of the distribution, a QQ-plot compared to the theoretical distribution, and scatterplots versus the independent variable and versus the population predictions from the model

Usage

```
npde.plot.default(npdeObject, ...)
```

Arguments

| | |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| ... | additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as set.plotoptions) |

Value

a ggplot object or a list of ggplot objects (grobs)

npde.plot.dist *Distribution plots of pd/npde*

Description

Produces a plot of the cdistribution of a metric compared to their theoretical distribution. Three types of distribution plots are available: a histogram, a QQ-plot, or the empirical cdf.

Usage

```
npde.plot.dist(npdeObject, which="npd", dist.type="qqplot", ...)
```

Arguments

| | |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| which | a string determining which metric to plot (one of "npde", "pd" or "npd"), defaults to "npd" |
| dist.type | string, one of "ecdf" (empirical cumulative density function), "hist" (histogram) or "qqplot" (QQ-plot of the empirical distribution versus the theoretical quantiles) to determine which type of plot (default is "qqplot") |
| ... | additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as set.plotoptions) |

Value

npde.plot.loq *Plot of the probability that the observations are below the LOQ*

Description

Plots the probability that the observations are below the LOQ along with the model predicted interval

Usage

```
npde.plot.loq(npdeObject, xaxis="x", nsim=200, ...)
```

Arguments

| | |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| xaxis | a string character, one of "x" (to plot $P(Y < LOQ)$ versus the value of the independent predictor) or "ypred" (versus the value of the population predictions). Defaults to "x" |
| nsim | number of simulations to be used for the computation of the prediction interval |
| ... | additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as set.plotoptions) |

Value

npde.plot.npde *Plots for pd and npde*

Description

Plots for pd and npde

Usage

npde.plot.pd(npdeObject, ...)

npde.plot.npde(npdeObject, ...)

npde.plot.npd(npdeObject, ...)

Arguments

npdeObject an object returned by a call to [npde](#) or [autonpde](#)
 ... additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as [set.plotoptions](#))

Value

a ggplot object or a list of ggplot objects (grobs)

npde.plot.scatterplot *##### Scatterplots - VPC, scatterplots versus independent variable, predictions, covariates ##### Scatterplots and VPC*

Description

Produces a scatterplot. Different types of scatterplots can be produced, with associated prediction bands (see details).

Usage

npde.plot.scatterplot(npdeObject, which.x="x", which.y="npd", ref.prof=NULL, ...)

Arguments

| | |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| which.x | a string specifying the variable on the X-axis (one of "x", "pred", "cov") |
| which.y | a string specifying the variable on the Y-axis (one of "yobs", "npde", "pd", "npd"), defaults to "npd" |
| ref.prof | either a character string (one of "covariate" or "all"), or a named list specifying the characteristics of the reference profile (see details) |
| ... | additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as set.plotoptions and npdeControl) |

Details

VPC: obtained using `which.x="x"`, `which.y="yobs"`

Scatterplots of npde/pd/npd can be obtained versus "x" (independent variable) or "pred" (population predictions from the model)

Scatterplots of npde/pd/npd/observations can be obtained versus covariates by setting the `which.x` argument to "cov" and selecting the appropriate `which.y`. The function will use the covariates in the `which.cov` element of the `prefs` slot. This can be overridden to cycle over all the covariates in the dataset by supplying the argument `which.cov="all"` in the call to the function.

Reference profile: a reference profile can be added to scatterplots of npd and npde versus the independent variable (see Comets et al. 2013)

If `ref.prof="all"` (and `covsplit` is FALSE), the reference plot will be computed over all subjects using the mean and SD of all simulated data in each bin (see documentation).

If `ref.prof="covariate"` and an additional argument `covsplit` is given (`covsplit=TRUE`), the reference plot will be adjusted for each covariate category over all the covariates in the `which.cov` element of the `prefs` slot (see [npdeControl](#) for details on the `prefs` slot of the `npdeObject`).

If `ref.prof` is given as a named list (eg `list(ID=c(1,5))` or `list(sex=0, dose=c(50,100))`), where names should refer to columns in the data file (eg ID should be a column in the data), the reference profile will be obtained by combining (in the first example above, the reference profile will be obtained using the simulated data for subjects 1 and 5, while in the second example it will be computed using the subjects with `sex=0` given doses 50 or 100).

Value

a ggplot object or a list of ggplot objects (grobs)

| | |
|------------------|-------------------------------------|
| npde.plot.select | Select plot for a NpdeObject object |
|------------------|-------------------------------------|

Description

Select plot for a NpdeObject object

Usage

```
npde.plot.select(npdeObject, data=FALSE, ecdf=FALSE, qqplot=FALSE, histogram=FALSE,
x.scatter=FALSE, pred.scatter=FALSE, x.box=FALSE, pred.box=FALSE, cov.scatter=FALSE,
cov.x.scatter=FALSE, cov.pred.scatter=FALSE, cov.x.box=FALSE, cov.pred.box=FALSE,
cov.ecdf=FALSE, cov.hist=FALSE, cov.qqplot=FALSE, vpc=FALSE, ...)
```

Arguments

| | |
|------------------|-------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| data | boolean, whether to produce a plot of the data |
| ecdf | boolean, whether to produce a distribution plot of the empirical distribution function |
| qqplot | boolean, whether to produce a QQ-plot of the empirical distribution function |
| histogram | boolean, whether to produce a histogram of the metric |
| x.scatter | boolean, whether to produce a scatterplot of the metric as a function of X |
| pred.scatter | boolean, whether to produce a scatterplot of the metric as a function of predictions |
| x.box | boolean, whether to produce whisker plots of the metric as a function of X |
| pred.box | boolean, whether to produce whisker plots of the metric as a function of predictions |
| cov.scatter | boolean, whether to produce a scatterplot of the metric as a function of covariate(s) |
| cov.x.scatter | boolean, whether to produce a scatterplot of the metric as a function of X, split by covariate(s) |
| cov.pred.scatter | boolean, whether to produce a scatterplot of the metric as a function of predictions, split by covariate(s) |
| cov.x.box | boolean, whether to produce whisker plots of the metric as a function of X, split by covariate(s) |

| | |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>cov.pred.box</code> | boolean, whether to produce whisker plots of the metric as a function of predictions, split by covariate(s) |
| <code>cov.ecdf</code> | boolean, whether to produce a distribution plot of the empirical distribution function, split by covariate(s) |
| <code>cov.hist</code> | boolean, whether to produce a distribution plot of the empirical distribution function, split by covariate(s) |
| <code>cov.qqplot</code> | boolean, whether to produce a distribution plot of the empirical distribution function, split by covariate(s) |
| <code>vpc</code> | boolean, whether to produce a VPC |
| <code>...</code> | additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as set.plotoptions) |

Value

a ggplot object or a list of ggplot objects (grobs)

Author(s)

Emmanuelle Comets <emmanuelle.comets@bichat.inserm.fr>

`npde.plot.splitcov` *Plots split by covariate for a NpdeObject object*

Description

Plots split by covariate for a NpdeObject object (equivalent to using `covsplit=TRUE` with the appropriate `plot.type`)

Usage

```
npde.plot.splitcov(npdeObject, which.plot="x", ...)
```

Arguments

| | |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| npdeObject | an object returned by a call to npde or autonpde |
| which.plot | one of "x" (scatterplots of the metric versus X), "pred" (scatterplots of the metric versus predictions), "ecdf" (empirical distribution function), "hist" (histogram), "qqplot" |
| ... | additional arguments to be passed on to the function, to control which metric (npde, pd, npd) is used or to override graphical parameters (see the PDF document for details, as well as set.plotoptions) |

Value

a ggplot object or a list of ggplot objects (grobs)

| | |
|-----------|--------------------------------------------------------------------|
| npde.save | <i>Save the results contained in a NpdeObject object to a file</i> |
|-----------|--------------------------------------------------------------------|

Description

Save the results to a table on disk

Usage

```
npde.save(object, ...)
```

Arguments

| | |
|--------|-------------------------------------------------|
| object | a NpdeObject object |
| ... | optional arguments to replace options in object |

Details

The following options can be changed by passing the appropriate arguments: namsav (string giving the root name of the files, an extension .npde will be added), namerres (string giving the full name of the file)

Value

No return value, called for side effects

References

K. Brendel, E. Comets, C. Laffont, C. Laveille, and F.Mentre. Metrics for external model evaluation with an application to the population pharmacokinetics of gliclazide. *Pharmaceutical Research*, 23:2036–49, 2006.

 npdeControl

Set options for an NpdeObject

Description

Set, replace and check options for an NpdeObject

Usage

```
npdeControl(boolsave = TRUE, namsav = "output", type.graph = "eps",
  verbose = FALSE, calc.npde = TRUE, calc.npd = TRUE, decorr.method = "cholesky",
  cens.method = "omit", ties = TRUE, sample = FALSE)
```

```
check.control.options(opt)
```

```
replace.control.options(opt, ...)
```

```
replace.control.options(opt, ...)
```

```
check.control.options(opt)
```

Arguments

| | |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| boolsave | whether to save the results (a file containing the numerical results and a file with the graphs) |
| namsav | the root name of the files to save to (the file with the results will be named ROOTNAME.npde and the graphs will be saved to ROOTNAME.format where format is given by the type.graph argument) |
| type.graph | type of graph to save to (one of "eps", "pdf", "jpeg", "png") |
| verbose | a boolean; if TRUE, a message is printed as the computation of the npde begins for each new subject |
| calc.npde | a boolean; TRUE to compute npde |
| calc.npd | a boolean; TRUE to compute npd |
| decorr.method | the method used to decorrelate simulated and observed data (see npde.decorr.method) |
| cens.method | the method used to handle censored data (see npde.cens.method) |
| ties | if FALSE, a smoothing will be applied to prediction discrepancies to avoid ties |
| sample | if TRUE, the test on the pd will be performed after randomly sampling only pd per subject |
| opt | a list of control options to be checked |
| ... | named parameters to be changed. The names will be compared to the names of the control variables and changed, with warnings issued for names that do not match. |

Value

A list of settings for the computation of pd/npde

| | |
|----------|----------------------------------|
| npdeData | <i>Creates a NpdeData object</i> |
|----------|----------------------------------|

Description

This function is used to create a NpdeData object, representing a longitudinal data structure, and fill it with data from a dataframe or a file on disk

Usage

```
npdeData(name.data,header=TRUE,sep="",na.strings=c(".", "NA"),name.group,
name.predictor, name.response, name.covariates,name.cens,name.miss,name.ipred,
units=list(x="",y=""),covariates=c()), detect=TRUE,verbose=FALSE)
```

Arguments

| | |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name.data | name of the file containing the observed data, or a dataframe containing the observed data |
| header | boolean indicating whether the file has a header (mandatory if detect is TRUE) |
| sep | field separator (for files on disk) |
| na.strings | strings to be considered as indicating NA |
| name.group | name/number of the column in the observed data containing the patient ID (if missing and detect is TRUE, columns named id, subject or sujet (regardless of case) will be assumed to contain this information) |
| name.predictor | name/number of the column in the observed data containing the independent variable X (if missing and detect is TRUE, columns named xobs, time, dose, x, temps, tim (regardless of case) will be assumed to contain this information) |
| name.response | name/number of the column in the observed data containing the dependent variable Y (if missing and detect is TRUE, columns named yobs, response, resp, conc, concentration (regardless of case) will be assumed to contain this information) |
| name.covariates | name/number of the column(s) containing covariate information (optional) |
| name.cens | name/number of the column containing information about censored data (cens) (if missing and detect is TRUE, column with a name containing cens (regardless of case) will be assumed to contain this information) |
| name.miss | name/number of the column containing information about missing data (MDV) (if missing and detect is TRUE, column called mdv or miss (regardless of case) will be assumed to contain this information) |

| | |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name.ipred | name/number of the column(s) with individual predictions (ipred) (if missing and detect is TRUE, column with a name containing ipred (regardless of case) will be assumed to contain this information) |
| units | a list with components x, y and cov (optional), specifying the units respectively for the predictor (x), the response (y), and the covariates (a vector of length equal to the number of covariates). Units will default to (-) if not given. |
| detect | a boolean controlling whether automatic recognition of columns in the dataset is on, defaults to TRUE |
| verbose | whether to print warning messages, defaults to FALSE (set to TRUE to check how data is being handled) |

Value

an object of class NpdeData

Author(s)

Emmanuelle Comets <emmanuelle.comets@bichat.inserm.fr>

References

Examples

```
data(theopp)

x<-npdeData(theopp) # Automatic detection
print(x)
x<-npdeData(theopp,name.group="ID",name.predictor="Time",name.response="Conc",
name.covariates=c("Wt"),units=list(x="hr",y="mg/L",covariates="kg")) # Explicit
print(x)
```

NpdeData-class

Class "NpdeData" representing the structure of the longitudinal data

Description

A longitudinal data structure

Objects from the Class

NpdeData objects are typically created by a call to `npdeData` contain the following slots:

name.group character string giving the name of the grouping term (ID)
name.predictor character string giving the name of the predictor (X)
name.response character string giving the name of the response (Y)
name.cens character string giving the name of the censoring indicator
name.mdv character string giving the name of the missing data indicator
name.covariates vector of character string giving the name(s) of the covariates
name.ipred character string giving the name of the individual predictions
units (optional) a list with the units for X, Y, and covariates
data a dataframe containing the data
N number of subjects
ntot.obs total number of non-missing observations
nind.obs vector of size N giving the number of non-missing observations for each subject
ind index of non-missing observations
icens index of censored observations (non-missing)
not.miss a vector of boolean indicating for each observation whether it is missing (FALSE) or available (TRUE)
loq the censoring value

Methods

show(npde.data): Prints a short summary of object npde.data
qqplot.npde(npde.data): QQ-plot for NpdeData object (TODO: change for NpdeObject in final package)

Examples

```
methods(class="NpdeData")
showClass("NpdeData")
```

NpdeObject-class *Class "NpdeObject"*

Description

An object of class NpdeObject

Objects from the Class

NpdeObject objects are typically created by calls to [npde](#) or [autonpde](#). They contain the following slots:

data an object of class NpdeData, containing the observed data

sim.data an object of class NpdeSimData, containing the simulated data

results an object of class NpdeRes, containing the results

options a list of options

prefs a list of graphical preferences for the plots

Methods

print(x): Prints a summary of object

show(x): Prints a short summary of object

showall(x): Prints a detailed summary of object

plot(x): Diagnostic and other plots. More details can be found in [plot.NpdeObject](#)

summary(x): Returns a summary of object x in list format

gof.test(x, parametric=TRUE, ...): Returns goodness-of-fit tests

set.plotoptions(x): Sets options for graphs (internal method used in plots)

methods(class="NpdeObject")
```

```
showClass("NpdeObject")
```

npdeSimData

Creates a NpdeSimData object

Description

This function is used to create a NpdeSimData object containing the simulated data corresponding to an NpdeData object

Usage

```
npdeSimData(npde.data, name.simdata, header=TRUE, verbose=FALSE)
```

Arguments

| | |
|---------------------------|-------------------------------------------------------------------------------------------------------|
| <code>npde.data</code> | a NpdeData object |
| <code>name.simdata</code> | name of the file containing the simulated data, or a dataframe containing it |
| <code>header</code> | boolean indicating whether the file has a header (mandatory if <code>detect</code> is TRUE) |
| <code>verbose</code> | whether to print warning messages, defaults to FALSE (set to TRUE to check how data is being handled) |

Value

an object of class NpdeSimData

Author(s)

Emmanuelle Comets <emmanuelle.comets@bichat.inserm.fr>

[NpdeData](#), [npde](#), [autonpde](#)

| | |
|-------------------|--------------------------------------------------------------------------------|
| NpdeSimData-class | <i>Class "NpdeSimData" representing the structure of the longitudinal data</i> |
|-------------------|--------------------------------------------------------------------------------|

Description

A longitudinal data structure, with simulated data

Objects from the Class

NpdeSimData objects are created by associating an NpdeData object with matching simulated data, and they contain the following slots.

nrep number of replications)

datsim a dataframe containing the simulated data, with columns: `idsim` (subject id), `irsim` (replication index), `xsim` (simulated x), `ysim` (simulated response). After a call to [npde](#) or [autonpde](#), an additional column `ydsim` (decorrelated replicated data) will be added.

Methods

print(npde.simdata): Prints a summary of object `npde.simdata`

show(npde.simdata): Prints a short summary of object `npde.simdata`

showall(npde.simdata): Prints a detailed summary of object `npde.simdata`

See Also

[npde](#), [autonpde](#)

Examples

```
showClass("NpdeSimData")
```

| | |
|---------------|--------------------------------|
| plot.NpdeData | <i>Plots a NpdeData object</i> |
|---------------|--------------------------------|

Description

Plots the data in a NpdeData object

Usage

```
## S3 method for class 'NpdeData'  
plot(x, y, ...)
```

Arguments

| | |
|-----|-------------------------------------------------------------|
| x | a NpdeData object |
| y | unused, here for compatibility with the base plot function |
| ... | additional graphical parameters to be passed on to the plot |

Details

The default plot is a spaghetti plot of all the data, with a line joining the observations for each subject. If censored data is present, it is shown with a different symbol and colour.

Value

currently does not return anything, use `plot(x, plot.type="data")` on the `npdeObject` x (TODO; a `ggplot` object)

References

K. Brendel, E. Comets, C. Laffont, C. Laveille, and F.Mentre. Metrics for external model evaluation with an application to the population pharmacokinetics of gliclazide. *Pharmaceutical Research*, 23:2036–49, 2006.

See Also

[set.plotoptions](#)

Examples

```
data(theopp)

x<-npdeData(theopp,name.group="ID",name.predictor="Time",name.response="Conc",
name.covariates=c("Wt"),units=list(x="hr",y="mg/L",covariates="kg"))
plot(x)
```

| | |
|-----------------|----------------------------------|
| plot.NpdeObject | <i>Plots a NpdeObject object</i> |
|-----------------|----------------------------------|

Description

Plots the data and diagnostic plots in a NpdeObject object

Usage

```
## S3 method for class 'NpdeObject'
plot(x, y, ...)
```

Arguments

| | |
|-----|-------------------------------------------------------------------------------------------------------------|
| x | a NpdeObject object |
| y | unused, here for compatibility with the base plot function |
| ... | additional graphical parameters, which when given will supersede graphical preferences stored in the object |

Details

The default plots are represented as a 2x2 array with distribution plots on the top row (histogram and QQ-plot), and scatterplots of npde versus independent variable and population predictions on the bottom row. The graph is plotted in a graphic device window, unless the result is stored in an object (eg `myplot<-plot(x)`) which can then be printed (eg using `print(myplot)`).

Value

a ggplot object or a list of ggplot objects (grobs)

See Also

[set.plotoptions](#)

Examples

```
data(theopp)
data(simtheopp)

x<-autonpde(theopp,simtheopp,iid="ID",ix="Time", iy="Conc", boolsave=FALSE)
plot(x)
```

| | |
|-----------------------------|---------------------------------------------|
| <code>print.NpdeData</code> | <i>Prints objects from the npde package</i> |
|-----------------------------|---------------------------------------------|

Description

prints objects of classes `NpdeData`, `NpdeSimData`, `NpdeRes` and `NpdeObject`

Usage

```
## S3 method for class 'NpdeData'
print(x, nlines = 10, ...)

## S3 method for class 'NpdeRes'
print(x, nlines = 10, ...)

## S3 method for class 'NpdeObject'
print(x, nlines = 10, ...)
```

Arguments

| | |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>x</code> | an object of class <code>NpdeData</code> , <code>NpdeSimData</code> , <code>NpdeRes</code> or <code>NpdeObject</code> |
| <code>nlines</code> | number of lines from the dataset to print |
| <code>...</code> | Additional arguments (ignored) |

Value

None

set.plotoptions *Set graphical preferences*

Description

This function is used to set options for graphs

Usage

```
set.plotoptions(object)

## Default S3 method:
set.plotoptions(object)

## S3 method for class 'NpdeData'
set.plotoptions(object)

## S3 method for class 'NpdeObject'
set.plotoptions(object)
```

Arguments

object an object of class NpdeData or NpdeObject

Details

See documentation for a list of available options.

Value

a list of options for graphs

Arguments

object a NpdeData object

Value

No return value, shows the object

| | |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| simtheopp | <i>Simulated data for the computation of normalised prediction distribution errors in the theophylline dataset</i> |
|-----------|--------------------------------------------------------------------------------------------------------------------|

Description

The simtheopp dataset contains 100 simulations using the design of dataset [theopp](#). These simulations are used to compute npde. The control file used to perform the simulations can be found in the subdirectory 'doc' within the library npde.

Usage

```
simtheopp
```

Format

A data frame with 132000 rows and 3 variables This data frame contains the following columns:

- ID** an ordered factor with levels 1, ..., 12 identifying the subject on whom the observation was made. The ordering is first by simulation then by increasing time.
- xsim** time since drug administration when the sample was drawn (hr).
- ysim** simulated theophylline concentration (mg/L).

Details

See [theopp](#) for a description of the original dataset.

The simulated data was obtained using the software *NONMEM*. A one-compartment model was fit to the data. An exponential interindividual variability was assumed for the three parameters (absorption rate constant k_a , volume of distribution V and clearance CL) and a combined additive and proportional residual error model was used. The estimated parameters were then used to simulate 100 datasets with the same structure as the original dataset. Thus, for each observation in the original dataset, the simulated dataset contains 100 simulations under the model used for the estimation.

This dataset is provided so that users can figure out what type of data is needed for the computation of prediction distribution errors. More information can be found in the User Guide distributed along with this package, which contains a run-through of the theophylline example.

 skewness

Skewness

Description

Computes the skewness.

Usage

```
skewness(x)
```

Arguments

`x` a numeric vector containing the values whose skewness is to be computed. NA values are removed in the computation.

Details

If $N = \text{length}(x)$, then the skewness of x is defined as

$$N^{-1} \text{sd}(x)^{-3} \sum_i (x_i - \text{mean}(x))^3.$$

Value

The skewness of x .

References

G. Snedecor, W. Cochran. *Statistical Methods*, Wiley-Blackwell, 1989

Examples

```
x <- rnorm(100)
skewness(x)
```

| | |
|-----------------|-------------------------------------|
| subset.NpdeData | <i>Subsetting a NpdeData object</i> |
|-----------------|-------------------------------------|

Description

Return subset of data from a NpdeData object

Usage

```
## S3 method for class 'NpdeData'
subset(x, subset, ...)

## S3 method for class 'NpdeObject'
subset(x, subset, ...)
```

Arguments

`x` A NpdeData object

`subset` logical expression indicating elements or rows to keep: missing values are taken as false.

`...` Additional arguments (ignored)

Value

a NpdeData object with a subset of the original data

| | |
|------------------|-------------------------------------|
| summary.NpdeData | <i>Summary of a NpdeData object</i> |
|------------------|-------------------------------------|

Description

Extracts elements from a NpdeData object

Usage

```
## S3 method for class 'NpdeData'
summary(object, print = TRUE, ...)

## S3 method for class 'NpdeRes'
summary(object, print = TRUE, ...)

## S3 method for class 'NpdeObject'
summary(object, ...)
```

Arguments

| | |
|--------|-----------------------------------|
| object | A NpdeData object |
| print | whether to print to data to stdev |
| ... | Additional arguments (ignored) |

Value

A list with elements N (nb of subjects), data (dataframe containing the data), ntot.obs (total nb of observations), nind.obs (nb of observations per subject)

| | |
|--------|-----------------------------------------|
| theopp | <i>Pharmacokinetics of theophylline</i> |
|--------|-----------------------------------------|

Description

The theopp data frame has 132 rows and 5 columns of data from an experiment on the pharmacokinetics of theophylline.

Usage

```
theopp
```

Format

This data frame contains the following columns:

ID an ordered factor with levels 1, . . . , 12 identifying the subject on whom the observation was made. The ordering is by Time at which the observation was made.

Dose dose of theophylline administered orally to the subject (mg/kg).

Time time since drug administration when the sample was drawn (hr).

Conc theophylline concentration in the sample (mg/L).

Wt weight of the subject (kg).

Details

Boeckmann, Sheiner and Beal (1994) report data from a study by Dr. Robert Upton of the kinetics of the anti-asthmatic drug theophylline. Twelve subjects were given oral doses of theophylline then serum concentrations were measured at 11 time points over the next 25 hours.

These data are analyzed in Davidian and Giltinan (1995) and Pinheiro and Bates (2000) using a two-compartment open pharmacokinetic model.

These data are also available in the library datasets under the name Theoph in a slightly modified format and including the data at time 0. Here, we use the file in the format provided in the *NONMEM* installation path (see the User Guide for that software for details).

virload

Simulated HIV viral loads in HIV patients

Description

This is simulated data, based on real data obtained in a phase II clinical trial supported by the French Agency for AIDS Research, the COPHAR 3-ANRS 134 trial (Goujard et al., 2010). The original study included 35 patients, who received a once daily dose containing atazanavir (300 mg), ritonavir (100 mg), tenofovir disoproxil (245 mg) and emtricitabine (200 mg) during 24 weeks. Viral loads were measured 6 times over a treatment period of 24 weeks (day 0, 28, 56, 84, 112, 168).

Usage

virload

Format

This data frame contains the following columns:

ID an ordered factor with levels 1, ..., 50 identifying the subject on whom the observation was made. The ordering is by Time at which the observation was made.

Time time since the beginning of the study (days)

Log_VL logarithm (base 10) of the viral load (copies/L)

cens indicator variable (cens=1 for censored data, cens=0 for observed data)

ipred individual predictions

Details

The datasets were generated in a simulation study designed to evaluate the new method proposed to handle BQL data (Nguyen et al., 2011). Data was simulated using a simple bi-exponential HIV dynamic model describing the two-phase decline of viral load during anti-retroviral treatment.

The virload data frame has 300 rows and 4 columns of data. The dataset was then censored at two different LOQ levels (LOQ=20 or 50~copies/mL) to generate two datasets containing different proportions of BQL data, creating the data frames virload20 and virload50 respectively

The file simvirload contains 500 simulations under the same model. A full version of the simulated data with 1000 simulations can be downloaded from the github for npde3.0: <https://github.com/ecomets/npde30/blob/main/keep/data/simvirload.tab>

```

warfarin

Pharmacokinetics of warfarin

Description

The warfarin data frame has 251 rows and 8 columns of data containing data on the pharmacokinetics of warfarin, an anticoagulant drug used in the prevention of thrombosis and thromboembolism.

Usage

```
warfarin
```

Format

This data frame contains the following columns:

id an integer identifying the subject on whom the observation was made

time time since drug administration when the sample was drawn (hr)

amt total dose received by the subject (mg)

dv warfarin concentration in the sample (mg/L)

dvid observation type (1 for all observations)

wt weight of the subject (kg)

sex subject gender (0=female, 1=male)

age age of the subject (yr)

Details

The dataset is the PK part of a larger dataset including both warfarin concentrations and prothrombin complex activity (PCA), which measures the decreased coagulation activity resulting from the inhibition of vitamin K recycling, the mechanism of action of warfarin. It contains the concentrations measured in 32 healthy subjects after a single oral dose of warfarin sodium (1.5 mg/kg of body weight). The subjects in the study were sampled at different times over a period of up to 120 hours.

The data is distributed with the Monolix software as a demo for PK/PD modelling. The data has been slightly reformatted for R, removing the line at time=0 and filling the amt column with the dose for each subject, following the output of simulx which was used to simulate data from two alternative models to fit this dataset.

Two datasets containing simulated data are associated with the warfarin data. For each dataset, 1000 simulations of the original data were performed for the computation of npde. The package contains only the simulated data `simwarfarinCov` because of size constraints. `simwarfarinBase` can be downloaded from the github for npde3.0: <https://github.com/ecomets/npde30/blob/main/keep/data/simwarfarinBase.tab>

simwarfarinBase the data in this dataset was simulated according to a base model without covariates: the PK model was a two-compartment model, with first-order absorption and a time-delay. Interindividual variability was modelled as log-normal distributions for parameters T_{lag} , k_a , Cl and V_1 , and the error model was a combined error model. The parameters were estimated by Monolix.

simwarfarinCov the data in this dataset was simulated according to a model including several covariates: an age (centered on 30 yr) effect on Cl , a weight (centered on 70 kg) effect on Cl and V_1 , and a gender effect on V_1 . The covariate model was built in Monolix.

[,NpdeSimData-method] *Get/set methods for NpdeData object*

Description

Access slots of a NpdeData using the object["slot"] format

Usage

```
## S4 method for signature 'NpdeSimData'  
x[i, j, drop]  
  
## S4 method for signature 'NpdeData'  
x[i, j, drop]  
  
## S4 replacement method for signature 'NpdeData'  
x[i, j] <- value  
  
## S4 method for signature 'NpdeRes'  
x[i, j, drop]  
  
## S4 method for signature 'NpdeObject'  
x[i, j, drop]
```

Arguments

| | |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | object from which to extract element(s) or in which to replace element(s) |
| i, j | indices specifying elements to extract or replace. Indices are numeric or character vectors or empty (missing) or NULL |
| drop | For matrices and arrays. If TRUE the result is coerced to the lowest possible dimension (see the examples). This only works for extracting elements, not for the replacement. See drop for further details |
| value | typically an array-like R object of a similar class as x |
