Package 'paradox'

March 7, 2021

Type Package

Title Define and Work with Parameter Spaces for Complex Algorithms

Version 0.7.1

Description Define parameter spaces, constraints and dependencies for arbitrary algorithms, to program on such spaces. Also includes statistical designs and random samplers. Objects are implemented as 'R6' classes.

`paradox-package` *paradox: Define and Work with Parameter Spaces for Complex Algorithms*

Description

Define parameter spaces, constraints and dependencies for arbitrary algorithms, to program on such spaces. Also includes statistical designs and random samplers. Objects are implemented as 'R6' classes.

`assert_param` *Assertions for Params and ParamSets*

Description

Assertions for Params and ParamSets

Usage

```
assert_param(param, cl = "Param", no_untyped = FALSE, must_bounded = FALSE)

assert_param_set(
  param_set,
  cl = "Param",
  no_untyped = FALSE,
  must_bounded = FALSE,
  no_deps = FALSE
)
```

Arguments

`param`	(Param).
`cl`	(`character()`) Allowed subclasses.
`no_untyped`	(`logical(1)`) Are untyped Params allowed?
`must_bounded`	(`logical(1)`) Only bounded Params allowed?
`param_set`	(ParamSet).
`no_deps`	(`logical(1)`) Are dependencies allowed?

Value

The checked object, invisibly.

`Condition` *Dependency Condition*

Description

Condition object, to specify the condition in a dependency.

Currently implemented simple conditions

- `CondEqual$new(rhs)`
  Parent must be equal to `rhs`.
- `CondAnyOf$new(rhs)`
  Parent must be any value of `rhs`.

Public fields

`type` (`character(1)`)
: Name / type of the condition.

`rhs` (`any`)
: Right-hand-side of the condition.

Methods

Public methods:

- `Condition$new()`
- `Condition$test()`
- `Condition$as_string()`
- `Condition$format()`

- Condition$print()
- Condition$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
Condition$new(type, rhs)
```

Arguments:

`type` (`character(1)`)
Name / type of the condition.

`rhs` (`any`)
Right-hand-side of the condition.

Method `test()`**:** Checks if condition is satisfied. Called on a vector of parent param values.

Usage:

```
Condition$test(x)
```

Arguments:

`x` (`vector()`).

Returns: `logical(1)`.

Method `as_string()`**:** Conversion helper for print outputs.

Usage:

```
Condition$as_string(lhs_chr = "x")
```

Arguments:

`lhs_chr` (`character(1)`)

Method `format()`**:** Helper for print outputs.

Usage:

```
Condition$format()
```

Method `print()`**:** Printer.

Usage:

```
Condition$print(...)
```

Arguments:

`...` (ignored).

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Condition$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Design *Design of Configurations*

Description

A lightweight wrapper around a ParamSet and a `data.table::data.table()`, where the latter is a design of configurations produced from the former - e.g., by calling a `generate_design_grid()` or by sampling.

Public fields

`param_set` (ParamSet).

`data` (`data.table::data.table()`)
Stored data.

Methods

Public methods:

- `Design$new()`
- `Design$format()`
- `Design$print()`
- `Design$transpose()`
- `Design$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
Design$new(param_set, data, remove_dupl)
```

Arguments:

`param_set` (ParamSet).

`data` (`data.table::data.table()`)
Stored data.

`remove_dupl` (`logical(1)`)
Remove duplicates?

Method `format()`**:** Helper for print outputs.

Usage:

```
Design$format()
```

Method `print()`**:** Printer.

Usage:

```
Design$print(...)
```

Arguments:

`...` (ignored).

Method `transpose()`**:** Converts `data` into a list of lists of row-configurations, possibly removes `NA` entries of inactive parameter values due to unsatisfied dependencies, and possibly calls the `trafo` function of the ParamSet.

Usage:

```
Design$transpose(filter_na = TRUE, trafo = TRUE)
```

Arguments:

`filter_na (logical(1))`
Should `NA` entries of inactive parameter values due to unsatisfied dependencies be removed?

`trafo (logical(1))`
Should the `trafo` function of the ParamSet be called?

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Design$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

`Domain` *Domain: Parameter Range without an Id*

Description

A `Domain` object is a representation of a single dimension of a `ParamSet`. `Domain` objects are used to construct `ParamSet`s, either through the `ps()` short form, or through the `ParamSet`$search_space() mechanism (see `to_tune()`). `Domain` corresponds to a `Param` object, except it does not have an $id, and it *does* have a `trafo` and dependencies (`depends`) associated with it. For each of the basic `Param` classes (`ParamInt`, `ParamDbl`, `ParamLgl`, `ParamFct`, and `ParamUty`) there is a function constructing a `Domain` object (`p_int()`, `p_dbl()`, `p_lgl()`, `p_fct()`, `p_uty()`). They each have the same arguments as the corresponding `Param` $new() function, except without the `id` argument, and with the the additional parameters `trafo`, and `depends`.

`Domain` objects are representations of parameter ranges and are intermediate objects to be used in short form constructions in `to_tune()` and `ps()`. Because of their nature, they should not be modified by the user. The `Domain` object's internals are subject to change and should not be relid upon.

Usage

```
p_int(
  lower = -Inf,
  upper = Inf,
  special_vals = list(),
  default = NO_DEF,
  tags = character(),
  depends = NULL,
```

```
  trafo = NULL,
  logscale = FALSE
)

p_dbl(
  lower = -Inf,
  upper = Inf,
  special_vals = list(),
  default = NO_DEF,
  tags = character(),
  tolerance = sqrt(.Machine$double.eps),
  depends = NULL,
  trafo = NULL,
  logscale = FALSE
)

p_uty(
  default = NO_DEF,
  tags = character(),
  custom_check = NULL,
  depends = NULL,
  trafo = NULL
)

p_lgl(
  special_vals = list(),
  default = NO_DEF,
  tags = character(),
  depends = NULL,
  trafo = NULL
)

p_fct(
  levels,
  special_vals = list(),
  default = NO_DEF,
  tags = character(),
  depends = NULL,
  trafo = NULL
)
```

Arguments

lower	(numeric(1)) Lower bound, can be -Inf.
upper	(numeric(1)) Upper bound can be +Inf.
special_vals	(list())

Arbitrary special values this parameter is allowed to take, to make it feasible. This allows extending the domain of the parameter. Note that these values are only used in feasibility checks, neither in generating designs nor sampling.

`default` (any)
Default value. Can be from the domain of the parameter or an element of `special_vals`. Has value NO_DEF if no default exists. `NULL` can be a valid default. The value has no effect on `ParamSet$values` or the behavior of `ParamSet$check()`, $test() or $assert(). The `default` is intended to be used for documentation purposes. ‘

`tags` (`character()`)
Arbitrary tags to group and subset parameters. Some tags serve a special purpose:

- `"required"` implies that the parameters has to be given when setting `values` in ParamSet.

`depends` (`call | expression`)
An expression indicating a requirement for the parameter that will be constructed from this. Can be given as an expression (using `quote()`), or the expression can be entered directly and will be parsed using NSE (see examples). The expression may be of the form <Param> == <value> or <Param> %in% <values>, which will result in dependencies according to ParamSet$add_dep(on = "<Param>", cond = CondEqual$new(<value>)) or ParamSet$add_dep(on = "<Param>", cond = CondAnyOf$new(<values>)), respectively (see `CondEqual`, `CondAnyOf`). The expression may also contain multiple conditions separated by `&&`.

`trafo` (`function`)
Single argument function performing the transformation of a parameter. When the `Domain` is used to construct a `ParamSet`, this transformation will be applied to the corresponding parameter as part of the $trafo function.
Note that the trafo is *not* inherited by `TuneToken`s! Defining a parameter with e.g. `p_dbl(...,trafo = ...)` will *not* automatically give the `to_tune()` assigned to it a transformation. `trafo` only makes sense for `ParamSet`s that get used as search spaces for optimization or tuning, it is not useful when defining domains or hyperparameter ranges of learning algorithms, because these do not use trafos.

`logscale` (`logical(1)`)
Put numeric domains on a log scale. Default `FALSE`. Log-scale `Domains` represent parameter ranges where lower and upper bounds are logarithmized, and where a `trafo` is added that exponentiates sampled values to the original scale. This is *not* the same as setting `trafo = exp`, because `logscale = TRUE` will handle parameter bounds internally: a `p_dbl(1,10,logscale = TRUE)` results in a `ParamDbl` that has lower bound `0`, upper bound `log(10)`, and uses `exp` transformation on these. Therefore, the given bounds represent the bounds *after* the transformation. (see examples).
`p_int()` with `logscale = TRUE` results in a `ParamDbl`, not a `ParamInt`, but with bounds `log(max(lower,0.5))` ... `log(upper + 1)` and a trafo similar to `"as.integer(exp(x))"` (with additional bounds correction). The lower bound is lifted to `0.5` if `lower` 0 to handle the `lower == 0` case. The upper bound is

increased to log(upper + 1) because the trafo would otherwise almost never generate a value of upper.
When logscale is TRUE, then upper bounds may be infinite, but lower bounds should be greater than 0 for p_dbl() or greater or equal 0 for p_int().
Note that "logscale" is *not* inherited by TuneTokens! Defining a parameter with p_dbl(... logscale = TRUE) will *not* automatically give the to_tune() assigned to it log-scale. logscale only makes sense for ParamSets that get used as search spaces for optimization or tuning, it is not useful when defining domains or hyperparameter ranges of learning algorithms, because these do not use trafos.
logscale happens on a natural (e == 2.718282...) basis. Be aware that using a different base (log10()/10^, log2()/2^) is completely equivalent and does not change the values being sampled after transformation.

tolerance (numeric(1))
Initializes the $tolerance field that determines the

custom_check (function())
Custom function to check the feasibility. Function which checks the input. Must return 'TRUE' if the input is valid and a character(1) with the error message otherwise. This function should *not* throw an error. Defaults to NULL, which means that no check is performed.

levels (character | atomic | list)
Allowed categorical values of the parameter. If this is not a character, then a trafo is generated that converts the names (if not given: as.character() of the values) of the levels argument to the values. This trafo is then performed *before* the function given as the trafo argument.

Details

The p_fct function admits a levels argument that goes beyond the levels accepted by ParamFct$new(). Instead of a character vector, any atomic vector or list (optionally named) may be given. (If the value is a list that is not named, the names are inferred using as.character() on the values.) The resulting Domain will correspond to a range of values given by the names of the levels argument with a trafo that maps the character names to the arbitrary values of the levels argument.

Value

A Domain object.

See Also

Other ParamSet construction helpers: ps(), to_tune()

Examples

```
params = ps(
  unbounded_integer = p_int(),
  bounded_double = p_dbl(0, 10),
  half_bounded_integer = p_dbl(1),
  half_bounded_double = p_dbl(upper = 1),
  double_with_trafo = p_dbl(-1, 1, trafo = exp),
```

```
  extra_double = p_dbl(0, 1, special_vals = list("xxx"), tags = "tagged"),
  factor_param = p_fct(c("a", "b", "c")),
  factor_param_with_implicit_trafo = p_fct(list(a = 1, b = 2, c = list()))
)
print(params)

params$trafo(list(
  bounded_double = 1,
  double_with_trafo = 1,
  factor_param = "c",
  factor_param_with_implicit_trafo = "c"
))

# logscale:
params = ps(x = p_dbl(1, 100, logscale = TRUE))

# The ParamSet has bounds log(1) .. log(100):
print(params)

# When generating a equidistant grid, it is equidistant within log values
grid = generate_design_grid(params, 3)
print(grid)

# But the values are on a log scale with desired bounds after trafo
print(grid$transpose())

# Integer parameters with logscale are `ParamDbl`s pre-trafo
params = ps(x = p_int(0, 10, logscale = TRUE))
print(params)

grid = generate_design_grid(params, 4)
print(grid)

# ... but get transformed to integers.
print(grid$transpose())
```

`generate_design_grid` *Generate a Grid Design*

Description

Generate a grid with a specified resolution in the parameter space. The resolution for categorical parameters is ignored, these parameters always produce a grid over all their valid levels. For number params the endpoints of the params are always included in the grid.

Usage

```
generate_design_grid(param_set, resolution = NULL, param_resolutions = NULL)
```

Arguments

`param_set`	(ParamSet).
`resolution`	(`integer(1)`) Global resolution for all Params.
`param_resolutions`	(named `integer()`) Resolution per Param, named by parameter ID.

Value

Design.

See Also

Other generate_design: `generate_design_lhs()`, `generate_design_random()`

Examples

```
ps = ParamSet$new(list(
  ParamDbl$new("ratio", lower = 0, upper = 1),
  ParamFct$new("letters", levels = letters[1:3])
))
generate_design_grid(ps, 10)
```

---

generate_design_lhs *Generate a Space-Filling LHS Design*

Description

Generate a space-filling design using Latin hypercube sampling. Dependent parameters whose constraints are unsatisfied generate `NA` entries in their respective columns.

Usage

```
generate_design_lhs(param_set, n, lhs_fun = NULL)
```

Arguments

`param_set`	(ParamSet).
`n`	(`integer(1)`) Number of points to sample.
`lhs_fun`	(function(n, k)) Function to use to generate a LHS sample, with n samples and k values per param. LHS functions are implemented in package **lhs**, default is to use `lhs::maximinLHS()`.

Value

Design.

See Also

Other generate_design: generate_design_grid(), generate_design_random()

Examples

```
ps = ParamSet$new(list(
  ParamDbl$new("ratio", lower = 0, upper = 1),
  ParamFct$new("letters", levels = letters[1:3])
))

if (requireNamespace("lhs", quietly = TRUE)) {
  generate_design_lhs(ps, 10)
}
```

---

generate_design_random

Generate a Random Design

Description

Generates a design with randomly drawn points. Internally uses SamplerUnif, hence, also works for ParamSets with dependencies. If dependencies do not hold, values are set to NA in the resulting data.table.

Usage

```
generate_design_random(param_set, n)
```

Arguments

param_set	(ParamSet).
n	(integer(1)) Number of points to draw randomly.

Value

Design.

See Also

Other generate_design: generate_design_grid(), generate_design_lhs()

Examples

```
ps = ParamSet$new(list(
  ParamDbl$new("ratio", lower = 0, upper = 1),
  ParamFct$new("letters", levels = letters[1:3])
))
generate_design_random(ps, 10)
```

NO_DEF *Extra data type for "no default value"*

Description

Special new data type for no-default. Not often needed by the end-user, mainly internal.

- `NoDefault`: R6 factory.
- `NO_DEF`: R6 Singleton object for type, used in Param.
- `is_nodefault()`: Is an object of type 'no default'?

Param *Param Class*

Description

This is the abstract base class for parameter objects like ParamDbl and ParamFct.

S3 methods

- `as.data.table()`
  Param -> `data.table::data.table()`
  Converts param to `data.table::data.table()` with 1 row. See ParamSet.

Public fields

`id (character(1))`
: Identifier of the object.

`special_vals (list())`
: Arbitrary special values this parameter is allowed to take.

`default (any)`
: Default value.

`tags (character())`
: Arbitrary tags to group and subset parameters.

Active bindings

`class (character(1))`
: R6 class name. Read-only.

`is_number (logical(1))`
: `TRUE` if the parameter is of type `"dbl"` or `"int"`.

`is_categ (logical(1))`
: `TRUE` if the parameter is of type `"fct"` or `"lgl"`.

`has_default (logical(1))`
: Is there a default value?

Methods

Public methods:

- Param$new()
- Param$check()
- Param$assert()
- Param$test()
- Param$rep()
- Param$format()
- Param$print()
- Param$qunif()
- Param$convert()
- Param$clone()

Method `new()`**:** Creates a new instance of this R6 class.
Note that this object is typically constructed via derived classes, e.g., ParamDbl.

Usage:

```
Param$new(id, special_vals, default, tags)
```

Arguments:

`id` (`character(1)`)
Identifier of the object.

`special_vals` (`list()`)
Arbitrary special values this parameter is allowed to take, to make it feasible. This allows extending the domain of the parameter. Note that these values are only used in feasibility checks, neither in generating designs nor sampling.

`default` (`any`)
Default value. Can be from the domain of the parameter or an element of `special_vals`. Has value NO_DEF if no default exists. `NULL` can be a valid default. The value has no effect on `ParamSet$values` or the behavior of `ParamSet$check()`, $test() or $assert(). The `default` is intended to be used for documentation purposes. ‘

`tags` (`character()`)
Arbitrary tags to group and subset parameters. Some tags serve a special purpose:

- `"required"` implies that the parameters has to be given when setting `values` in ParamSet.

Method `check()`**:** **checkmate**-like check-function. Take a value from the domain of the parameter, and check if it is feasible. A value is feasible if it is of the same `storage_type`, inside of the bounds or element of `special_vals`.

Usage:

```
Param$check(x)
```

Arguments:

`x` (`any`).

Returns: If successful `TRUE`, if not a string with the error message.

Method `assert()`: **checkmate**-like assert-function. Take a value from the domain of the parameter, and assert if it is feasible. A value is feasible if it is of the same `storage_type`, inside of the bounds or element of `special_vals`.

Usage:

```
Param$assert(x)
```

Arguments:

`x` (any).

Returns: If successful `x` invisibly, if not an exception is raised.

Method `test()`: **checkmate**-like test-function. Take a value from the domain of the parameter, and test if it is feasible. A value is feasible if it is of the same `storage_type`, inside of the bounds or element of `special_vals`.

Usage:

```
Param$test(x)
```

Arguments:

`x` (any).

Returns: If successful `TRUE`, if not `FALSE`.

Method `rep()`: Repeats this parameter n-times (by cloning). Each parameter is named "[id]*rep*[k]" and gets the additional tag "[id]_rep".

Usage:

```
Param$rep(n)
```

Arguments:

`n` (`integer(1)`).

Returns: ParamSet.

Method `format()`: Helper for print outputs.

Usage:

```
Param$format()
```

Method `print()`: Printer.

Usage:

```
Param$print(
  ...,
 hide_cols = c("nlevels", "is_bounded", "special_vals", "tags", "storage_type")
)
```

Arguments:

`...` (ignored).

`hide_cols` (`character()`)
: Which fields should not be printed? Default is `"nlevels"`, `"is_bounded"`, `"special_vals"`, `"tags"`, and `"storage_type"`.

Method `qunif()`: Takes values from [0,1] and maps them, regularly distributed, to the domain of the parameter. Think of: quantile function or the use case to map a uniform-[0,1] random variable into a uniform sample from this param.

Usage:

```
Param$qunif(x)
```

Arguments:

`x` (`numeric(1)`).

Returns: Value of the domain of the parameter.

Method `convert()`**:** Converts a value to the closest valid param. Only for values that pass $check() and mostly used internally.

Usage:

```
Param$convert(x)
```

Arguments:

`x` (`any`).

Returns: `x` converted to a valid type for the `Param`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Param$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Params: `ParamDbl`, `ParamFct`, `ParamInt`, `ParamLgl`, `ParamUty`

`ParamDbl` *Numerical Parameter*

Description

A Param to describe real-valued parameters.

Super class

`paradox::Param` -> `ParamDbl`

Public fields

`lower` (`numeric(1)`)
: Lower bound. Always `NA` for ParamFct, ParamLgl and ParamUty.

`upper` (`numeric(1)`)
: Upper bound. Always `NA` for ParamFct, ParamLgl and ParamUty.

`tolerance` (`numeric(1)`)
: tolerance of values to accept beyond $lower and $upper. Used both for relative and absolute tolerance.

Active bindings

`levels (character() | NULL)`
: Set of allowed levels. Always `NULL` for ParamDbl, ParamInt and ParamUty. Always `c(TRUE,FALSE)` for ParamLgl.

`nlevels (integer(1) | Inf)`
: Number of categorical levels. Always `Inf` for ParamDbl and ParamUty. The number of integers in the range [lower, upper], or `Inf` if unbounded for ParamInt. Always `2` for ParamLgl.

`is_bounded (logical(1))`
: Are the bounds finite? Always `TRUE` for ParamFct and ParamLgl. Always `FALSE` for ParamUty.

`storage_type (character(1))`
: Data type when values of this parameter are stored in a data table or sampled. Always `"numeric"` for ParamDbl. Always `"character"` for ParamFct. Always `"integer"` for ParamInt. Always `"logical"` for ParamLgl. Always `"list"` for ParamUty.

Methods

Public methods:

- `ParamDbl$new()`
- `ParamDbl$convert()`
- `ParamDbl$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ParamDbl$new(
  id,
  lower = -Inf,
  upper = Inf,
  special_vals = list(),
  default = NO_DEF,
  tags = character(),
  tolerance = sqrt(.Machine$double.eps)
)
```

Arguments:

`id (character(1))`
: Identifier of the object.

`lower (numeric(1))`
: Lower bound, can be `-Inf`.

`upper (numeric(1))`
: Upper bound can be `+Inf`.

`special_vals (list())`
: Arbitrary special values this parameter is allowed to take, to make it feasible. This allows extending the domain of the parameter. Note that these values are only used in feasibility checks, neither in generating designs nor sampling.

`default` (any)
: Default value. Can be from the domain of the parameter or an element of `special_vals`. Has value NO_DEF if no default exists. `NULL` can be a valid default. The value has no effect on `ParamSet$values` or the behavior of `ParamSet$check()`, $test() or $assert(). The `default` is intended to be used for documentation purposes. ‘

`tags` (`character()`)
: Arbitrary tags to group and subset parameters. Some tags serve a special purpose:

  - `"required"` implies that the parameters has to be given when setting `values` in ParamSet.

`tolerance` (`numeric(1)`)
: Initializes the $tolerance field that determines the

Method `convert()`**:** Restrict the value to within the allowed range. This works in conjunction with $tolerance, which accepts values slightly out of this range.

Usage:

```
ParamDbl$convert(x)
```

Arguments:

`x` (`numeric(1)`)
: Value to convert.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ParamDbl$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Note

The upper and lower bounds in $check() are expanded by `sqrt(.Machine$double.eps)` to prevent errors due to the precision of double values.

See Also

Other Params: `ParamFct`, `ParamInt`, `ParamLgl`, `ParamUty`, `Param`

Examples

```
ParamDbl$new("ratio", lower = 0, upper = 1, default = 0.5)
```

ParamFct *Factor Parameter*

Description

A Param to describe categorical (factor) parameters.

Super class

paradox::Param -> ParamFct

Public fields

levels (character() | NULL)
: Set of allowed levels. Always NULL for ParamDbl, ParamInt and ParamUty. Always c(TRUE,FALSE) for ParamLgl.

Active bindings

lower (numeric(1))
: Lower bound. Always NA for ParamFct, ParamLgl and ParamUty.

upper (numeric(1))
: Upper bound. Always NA for ParamFct, ParamLgl and ParamUty.

nlevels (integer(1) | Inf)
: Number of categorical levels. Always Inf for ParamDbl and ParamUty. The number of integers in the range [lower, upper], or Inf if unbounded for ParamInt. Always 2 for ParamLgl.

is_bounded (logical(1))
: Are the bounds finite? Always TRUE for ParamFct and ParamLgl. Always FALSE for ParamUty.

storage_type (character(1))
: Data type when values of this parameter are stored in a data table or sampled. Always "numeric" for ParamDbl. Always "character" for ParamFct. Always "integer" for ParamInt. Always "logical" for ParamLgl. Always "list" for ParamUty.

Methods

Public methods:

- ParamFct$new()
- ParamFct$clone()

Method new(): Creates a new instance of this R6 class.

Usage:

```
ParamFct$new(
  id,
  levels,
  special_vals = list(),
  default = NO_DEF,
  tags = character()
)
```

Arguments:

`id (character(1))`
: Identifier of the object.

`levels (character())`
: Set of allowed levels.

`special_vals (list())`
: Arbitrary special values this parameter is allowed to take, to make it feasible. This allows extending the domain of the parameter. Note that these values are only used in feasibility checks, neither in generating designs nor sampling.

`default (any)`
: Default value. Can be from the domain of the parameter or an element of `special_vals`. Has value NO_DEF if no default exists. `NULL` can be a valid default. The value has no effect on `ParamSet$values` or the behavior of `ParamSet$check()`, $test() or $assert(). The `default` is intended to be used for documentation purposes. ‘

`tags (character())`
: Arbitrary tags to group and subset parameters. Some tags serve a special purpose:

  - `"required"` implies that the parameters has to be given when setting `values` in ParamSet.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ParamFct$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Params: `ParamDbl`, `ParamInt`, `ParamLgl`, `ParamUty`, `Param`

Examples

```
ParamFct$new("f", levels = letters[1:3])
```

ParamInt *Integer Parameter*

Description

A Param to describe integer parameters.

Methods

See Param.

Super class

paradox::Param -> ParamInt

Public fields

`lower (numeric(1))`
: Lower bound. Always NA for ParamFct, ParamLgl and ParamUty.

`upper (numeric(1))`
: Upper bound. Always NA for ParamFct, ParamLgl and ParamUty.

Active bindings

`levels (character() | NULL)`
: Set of allowed levels. Always NULL for ParamDbl, ParamInt and ParamUty. Always c(TRUE,FALSE) for ParamLgl.

`nlevels (integer(1) | Inf)`
: Number of categorical levels. Always Inf for ParamDbl and ParamUty. The number of integers in the range [lower, upper], or Inf if unbounded for ParamInt. Always 2 for ParamLgl.

`is_bounded (logical(1))`
: Are the bounds finite? Always TRUE for ParamFct and ParamLgl. Always FALSE for ParamUty.

`storage_type (character(1))`
: Data type when values of this parameter are stored in a data table or sampled. Always "numeric" for ParamDbl. Always "character" for ParamFct. Always "integer" for ParamInt. Always "logical" for ParamLgl. Always "list" for ParamUty.

Methods

Public methods:

- ParamInt$new()
- ParamInt$convert()
- ParamInt$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ParamInt$new(
  id,
  lower = -Inf,
  upper = Inf,
  special_vals = list(),
  default = NO_DEF,
  tags = character()
)
```

Arguments:

`id (character(1))`
: Identifier of the object.

`lower (numeric(1))`
: Lower bound, can be `-Inf`.

`upper (numeric(1))`
: Upper bound can be `+Inf`.

`special_vals (list())`
: Arbitrary special values this parameter is allowed to take, to make it feasible. This allows extending the domain of the parameter. Note that these values are only used in feasibility checks, neither in generating designs nor sampling.

`default (any)`
: Default value. Can be from the domain of the parameter or an element of `special_vals`. Has value NO_DEF if no default exists. `NULL` can be a valid default. The value has no effect on `ParamSet$values` or the behavior of `ParamSet$check()`, $test() or $assert(). The `default` is intended to be used for documentation purposes. ‘

`tags (character())`
: Arbitrary tags to group and subset parameters. Some tags serve a special purpose:

  - `"required"` implies that the parameters has to be given when setting `values` in ParamSet.

Method `convert()`**:** Converts a value to an integer.

Usage:

```
ParamInt$convert(x)
```

Arguments:

`x (numeric(1))`
: Value to convert.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ParamInt$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Params: `ParamDbl`, `ParamFct`, `ParamLgl`, `ParamUty`, `Param`

Examples

```
ParamInt$new("count", lower = 0, upper = 10, default = 1)
```

`ParamLgl` *Logical Parameter*

Description

A Param to describe logical parameters.

Super class

`paradox::Param` -> `ParamLgl`

Active bindings

`lower (numeric(1))`
: Lower bound. Always `NA` for ParamFct, ParamLgl and ParamUty.

`upper (numeric(1))`
: Upper bound. Always `NA` for ParamFct, ParamLgl and ParamUty.

`levels (character() | NULL)`
: Set of allowed levels. Always `NULL` for ParamDbl, ParamInt and ParamUty. Always `c(TRUE,FALSE)` for ParamLgl.

`nlevels (integer(1) | Inf)`
: Number of categorical levels. Always `Inf` for ParamDbl and ParamUty. The number of integers in the range [lower, upper], or `Inf` if unbounded for ParamInt. Always `2` for ParamLgl.

`is_bounded (logical(1))`
: Are the bounds finite? Always `TRUE` for ParamFct and ParamLgl. Always `FALSE` for ParamUty.

`storage_type (character(1))`
: Data type when values of this parameter are stored in a data table or sampled. Always `"numeric"` for ParamDbl. Always `"character"` for ParamFct. Always `"integer"` for ParamInt. Always `"logical"` for ParamLgl. Always `"list"` for ParamUty.

Methods

Public methods:

- `ParamLgl$new()`
- `ParamLgl$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ParamLgl$new(id, special_vals = list(), default = NO_DEF, tags = character())
```

Arguments:

`id (character(1))`
Identifier of the object.

`special_vals (list())`
Arbitrary special values this parameter is allowed to take, to make it feasible. This allows extending the domain of the parameter. Note that these values are only used in feasibility checks, neither in generating designs nor sampling.

`default (any)`
Default value. Can be from the domain of the parameter or an element of `special_vals`. Has value NO_DEF if no default exists. `NULL` can be a valid default. The value has no effect on `ParamSet$values` or the behavior of `ParamSet$check()`, $test() or $assert(). The `default` is intended to be used for documentation purposes. ‘

`tags (character())`
Arbitrary tags to group and subset parameters. Some tags serve a special purpose:

- `"required"` implies that the parameters has to be given when setting `values` in ParamSet.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ParamLgl$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Params: `ParamDbl`, `ParamFct`, `ParamInt`, `ParamUty`, `Param`

Examples

```
ParamLgl$new("flag", default = TRUE)
```

`ParamSet` *ParamSet*

Description

A set of Param objects. Please note that when creating a set or adding to it, the parameters of the resulting set have to be uniquely named with IDs with valid R names. The set also contains a member variable `values` which can be used to store an active configuration / or to partially fix some parameters to constant values (regarding subsequent sampling or generation of designs).

S3 methods and type converters

- as.data.table()
  ParamSet -> data.table::data.table()
  Compact representation as datatable. Col types are:
  - id: character
  - lower, upper: double
  - levels: list col, with NULL elements
  - special_vals: list col of list
  - is_bounded: logical
  - default: list col, with NULL elements
  - storage_type: character
  - tags: list col of character vectors

Public fields

`assert_values (logical(1))`
Should values be checked for validity during assigment to active binding $values? Default is TRUE, only switch this off if you know what you are doing.

Active bindings

`params (named list())`
List of Param, named with their respective ID.

`params_unid (named list())`
List of Param, named with their true ID. However, this field has the Param's $id value set to a potentially invalid value. This active binding should only be used internally.

`deps (data.table::data.table())`
Table has cols id (character(1)) and on (character(1)) and cond (Condition). Lists all (direct) dependency parents of a param, through parameter IDs. Internally created by a call to add_dep. Settable, if you want to remove dependencies or perform other changes.

`set_id (character(1))`
ID of this param set. Default "". Settable.

`length (integer(1))`
Number of contained Params.

`is_empty (logical(1))`
Is the ParamSet empty?

`class (named character())`
Classes of contained parameters, named with parameter IDs.

`lower (named double())`
Lower bounds of parameters (NA if parameter is not numeric). Named with parameter IDs.

`upper (named double())`
Upper bounds of parameters (NA if parameter is not numeric). Named with parameter IDs.

`levels` (named `list()`)
: List of character vectors of allowed categorical values of contained parameters. `NULL` if the parameter is not categorical. Named with parameter IDs.

`nlevels` (named `integer()`)
: Number of categorical levels per parameter, `Inf` for double parameters or unbounded integer parameters. Named with param IDs.

`is_bounded` (named `logical()`)
: Do all parameters have finite bounds? Named with parameter IDs.

`special_vals` (named `list()` of `list()`)
: Special values for all parameters. Named with parameter IDs.

`default` (named `list()`)
: Default values of all parameters. If no default exists, element is not present. Named with parameter IDs.

`tags` (named `list()` of `character()`)
: Can be used to group and subset parameters. Named with parameter IDs.

`storage_type` (`character()`)
: Data types of parameters when stored in tables. Named with parameter IDs.

`is_number` (named `logical()`)
: Position is TRUE for ParamDbl and ParamInt. Named with parameter IDs.

`is_categ` (named `logical()`)
: Position is TRUE for ParamFct and ParamLgl. Named with parameter IDs.

`all_numeric` (`logical(1)`)
: Is `TRUE` if all parameters are ParamDbl or ParamInt.

`all_categorical` (`logical(1)`)
: Is `TRUE` if all parameters are ParamFct and ParamLgl.

`trafo` (function(x, param_set))
: Transformation function. Settable. User has to pass a function(x, param_set), of the form (named `list()`, ParamSet) -> named `list()`.
The function is responsible to transform a feasible configuration into another encoding, before potentially evaluating the configuration with the target algorithm. For the output, not many things have to hold. It needs to have unique names, and the target algorithm has to accept the configuration. For convenience, the self-paramset is also passed in, if you need some info from it (e.g. tags). Is NULL by default, and you can set it to NULL to switch the transformation off.

`has_trafo` (`logical(1)`)
: Has the set a `trafo` function?

`values` (named `list()`)
: Currently set / fixed parameter values. Settable, and feasibility of values will be checked when you set them. You do not have to set values for all parameters, but only for a subset. When you set values, all previously set values will be unset / removed.

`has_deps` (`logical(1)`)
: Has the set parameter dependencies?

Methods

Public methods:

- ParamSet$new()
- ParamSet$add()
- ParamSet$ids()
- ParamSet$get_values()
- ParamSet$subset()
- ParamSet$search_space()
- ParamSet$check()
- ParamSet$test()
- ParamSet$assert()
- ParamSet$check_dt()
- ParamSet$test_dt()
- ParamSet$assert_dt()
- ParamSet$add_dep()
- ParamSet$format()
- ParamSet$print()
- ParamSet$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ParamSet$new(params = named_list())
```

Arguments:

`params` (`list()`)
List of Param, named with their respective ID. Parameters are cloned.

Method `add()`**:** Adds a single param or another set to this set, all params are cloned.

Usage:

```
ParamSet$add(p)
```

Arguments:

`p` (Param | ParamSet).

Method `ids()`**:** Retrieves IDs of contained parameters based on some filter criteria selections, `NULL` means no restriction. Only returns IDs of parameters that satisfy all conditions.

Usage:

```
ParamSet$ids(class = NULL, is_bounded = NULL, tags = NULL)
```

Arguments:

`class` (`character()`).

`is_bounded` (`logical(1)`).

`tags` (`character()`).

Returns: `character()`.

Method `get_values()`: Retrieves parameter values based on some selections, `NULL` means no restriction and is equivalent to $values. Only returns values of parameters that satisfy all conditions.

Usage:

```
ParamSet$get_values(
  class = NULL,
  is_bounded = NULL,
  tags = NULL,
  type = "with_token",
  check_required = TRUE
)
```

Arguments:

`class` (`character()`).

`is_bounded` (`logical(1)`).

`tags` (`character()`).

`type` (`character(1)`)
Return values `with_token`, `without_token` or `only_token`?

`check_required` (`logical(1)`)
Check if all required parameters are set?

Returns: Named `list()`.

Method `subset()`: Changes the current set to the set of passed IDs.

Usage:

```
ParamSet$subset(ids)
```

Arguments:

`ids` (`character()`).

Method `search_space()`: Construct a `ParamSet` to tune over. Constructed from `TuneToken` in $values, see `to_tune()`.

Usage:

```
ParamSet$search_space(values = self$values)
```

Arguments:

`values` (named list): optional named list of `TuneToken` objects to convert, in place of $values.

Method `check()`: **checkmate**-like check-function. Takes a named list. A point x is feasible, if it configures a subset of params, all individual param constraints are satisfied and all dependencies are satisfied. Params for which dependencies are not satisfied should not be part of `x`.

Usage:

```
ParamSet$check(xs)
```

Arguments:

`xs` (named `list()`).

Returns: If successful `TRUE`, if not a string with the error message.

Method `test()`: **checkmate**-like test-function. Takes a named list. A point x is feasible, if it configures a subset of params, all individual param constraints are satisfied and all dependencies are satisfied. Params for which dependencies are not satisfied should not be part of `x`.

Usage:

```
ParamSet$test(xs)
```

Arguments:

`xs` (named `list()`).

Returns: If successful `TRUE`, if not `FALSE`.

Method `assert()`: **checkmate**-like assert-function. Takes a named list. A point x is feasible, if it configures a subset of params, all individual param constraints are satisfied and all dependencies are satisfied. Params for which dependencies are not satisfied should not be part of `x`.

Usage:

```
ParamSet$assert(xs, .var.name = vname(xs))
```

Arguments:

`xs` (named `list()`).

`.var.name` (`character(1)`)
Name of the checked object to print in error messages.
Defaults to the heuristic implemented in vname.

Returns: If successful `xs` invisibly, if not an error message.

Method `check_dt()`: **checkmate**-like check-function. Takes a data.table::data.table where rows are points and columns are parameters. A point x is feasible, if it configures a subset of params, all individual param constraints are satisfied and all dependencies are satisfied. Params for which dependencies are not satisfied should be set to `NA` in `xdt`.

Usage:

```
ParamSet$check_dt(xdt)
```

Arguments:

`xdt` (data.table::data.table | `data.frame()`).

Returns: If successful `TRUE`, if not a string with the error message.

Method `test_dt()`: **checkmate**-like test-function (s. $check_dt()).

Usage:

```
ParamSet$test_dt(xdt)
```

Arguments:

`xdt` (data.table::data.table).

Returns: If successful `TRUE`, if not `FALSE`.

Method `assert_dt()`: **checkmate**-like assert-function (s. $check_dt()).

Usage:

```
ParamSet$assert_dt(xdt, .var.name = vname(xdt))
```

Arguments:

`xdt` (data.table::data.table).

`.var.name` (`character(1)`)
Name of the checked object to print in error messages.
Defaults to the heuristic implemented in vname.

Returns: If successful `xs` invisibly, if not an error message.

Method `add_dep()`**:** Adds a dependency to this set, so that param `id` now depends on param `on`.

Usage:

```
ParamSet$add_dep(id, on, cond)
```

Arguments:

`id` (`character(1)`).

`on` (`character(1)`).

`cond` (Condition).

Method `format()`**:** Helper for print outputs.

Usage:

```
ParamSet$format()
```

Method `print()`**:** Printer.

Usage:

```
ParamSet$print(
  ...,
 hide_cols = c("levels", "is_bounded", "special_vals", "tags", "storage_type")
)
```

Arguments:

`...` (ignored).

`hide_cols` (`character()`)
Which fields should not be printed? Default is `"levels"`, `"is_bounded"`, `"special_vals"`, `"tags"`, and `"storage_type"`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ParamSet$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
ps = ParamSet$new(
  params = list(
    ParamDbl$new("d", lower = -5, upper = 5, default = 0),
    ParamFct$new("f", levels = letters[1:3])
  )
)
```

```
ps$trafo = function(x, param_set) {
  x$d = 2^x$d
  return(x)
}

ps$add(ParamInt$new("i", lower = 0L, upper = 16L))

ps$check(list(d = 2.1, f = "a", i = 3L))
```

`ParamSetCollection` *ParamSetCollection*

Description

A collection of multiple ParamSet objects.

- The collection is basically a light-weight wrapper / container around references to multiple sets.
- In order to ensure unique param names, every param in the collection is referred to with "<set_id>.<param_id>". Parameters from ParamSets with empty (i.e. `""`) $set_id are referenced directly. Multiple ParamSets with $set_id `""` can be combined, but their parameter names must be unique.
- Operation `subset` is currently not allowed.
- Operation `add` currently only works when adding complete sets not single params.
- When you either ask for 'values' or set them, the operation is delegated to the individual, contained param set references. The collection itself does not maintain a `values` state. This also implies that if you directly change `values` in one of the referenced sets, this change is reflected in the collection.
- Dependencies: It is possible to currently handle dependencies
  - regarding parameters inside of the same set - in this case simply add the dependency to the set, best before adding the set to the collection
  - across sets, where a param from one set depends on the state of a param from another set - in this case add call `add_dep` on the collection.

  If you call `deps` on the collection, you are returned a complete table of dependencies, from sets and across sets.

Super class

`paradox::ParamSet` -> `ParamSetCollection`

Active bindings

`params` (named `list()`)
: List of Param, named with their respective ID.

`params_unid` (named `list()`)
: List of Param, named with their true ID. However, this field has the Param's $id value set to a potentially invalid value. This active binding should only be used internally.

`deps` (`data.table::data.table()`)
: Table has cols `id` (`character(1)`) and `on` (`character(1)`) and `cond` (Condition). Lists all (direct) dependency parents of a param, through parameter IDs. Internally created by a call to `add_dep`. Settable, if you want to remove dependencies or perform other changes.

`values` (named `list()`)
: Currently set / fixed parameter values. Settable, and feasibility of values will be checked when you set them. You do not have to set values for all parameters, but only for a subset. When you set values, all previously set values will be unset / removed.

Methods

Public methods:

- `ParamSetCollection$new()`
- `ParamSetCollection$add()`
- `ParamSetCollection$remove_sets()`
- `ParamSetCollection$subset()`
- `ParamSetCollection$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ParamSetCollection$new(sets)
```

Arguments:

`sets` (`list()` of ParamSet)
: Parameter objects are cloned.

Method `add()`**:** Adds a set to this collection.

Usage:

```
ParamSetCollection$add(p)
```

Arguments:

`p` (ParamSet).

Method `remove_sets()`**:** Removes sets of given ids from collection.

Usage:

```
ParamSetCollection$remove_sets(ids)
```

Arguments:

`ids` (`character()`).

Method `subset()`**:** Only included for consistency. Not allowed to perform on ParamSetCollections.

Usage:

```
ParamSetCollection$subset(ids)
```

Arguments:

`ids (character())`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ParamSetCollection$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

`ParamUty` *Untyped Parameter*

Description

A Param to describe untyped parameters.

Super class

`paradox::Param` -> `ParamUty`

Public fields

`custom_check (function())`
: Custom function to check the feasibility.

Active bindings

`lower (numeric(1))`
: Lower bound. Always `NA` for ParamFct, ParamLgl and ParamUty.

`upper (numeric(1))`
: Upper bound. Always `NA` for ParamFct, ParamLgl and ParamUty.

`levels (character() | NULL)`
: Set of allowed levels. Always `NULL` for ParamDbl, ParamInt and ParamUty. Always `c(TRUE,FALSE)` for ParamLgl.

`nlevels (integer(1) | Inf)`
: Number of categorical levels. Always `Inf` for ParamDbl and ParamUty. The number of integers in the range [lower, upper], or `Inf` if unbounded for ParamInt. Always `2` for ParamLgl.

`is_bounded (logical(1))`
: Are the bounds finite? Always `TRUE` for ParamFct and ParamLgl. Always `FALSE` for ParamUty.

`storage_type (character(1))`
: Data type when values of this parameter are stored in a data table or sampled. Always `"numeric"` for ParamDbl. Always `"character"` for ParamFct. Always `"integer"` for ParamInt. Always `"logical"` for ParamLgl. Always `"list"` for ParamUty.

Methods

Public methods:

- ParamUty$new()
- ParamUty$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ParamUty$new(id, default = NO_DEF, tags = character(), custom_check = NULL)
```

Arguments:

`id (character(1))`
Identifier of the object.

`default (any)`
Default value. Can be from the domain of the parameter or an element of `special_vals`. Has value NO_DEF if no default exists. `NULL` can be a valid default. The value has no effect on `ParamSet$values` or the behavior of `ParamSet$check()`, $test() or $assert(). The `default` is intended to be used for documentation purposes. ‘

`tags (character())`
Arbitrary tags to group and subset parameters. Some tags serve a special purpose:

- `"required"` implies that the parameters has to be given when setting `values` in ParamSet.

`custom_check (function())`
Custom function to check the feasibility. Function which checks the input. Must return ’TRUE’ if the input is valid and a string with the error message otherwise. Defaults to `NULL`, which means that no check is performed.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ParamUty$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Params: ParamDbl, ParamFct, ParamInt, ParamLgl, Param

Examples

```
ParamUty$new("untyped", default = Inf)
```

ps *Construct a ParamSet using Short Forms*

Description

The `ps()` short form constructor uses `Domain` objects (`p_dbl`, `p_fct`, ...) to construct `ParamSet`s in a succinct and readable way.

For more specifics also see the documentation of `Domain`.

Usage

```
ps(..., .extra_trafo = NULL, .allow_dangling_dependencies = FALSE)
```

Arguments

`...`	(`Domain` | `Param`) Named arguments of `Domain` or `Param` objects. The `ParamSet` will be constructed of the given `Param`s, or of `Param`s constructed from the given domains. The names of the arguments will be used as $id (the $id of `Param` arguments are ignored).
`.extra_trafo`	(function(x, param_set)) Transformation to set the resulting `ParamSet`'s $trafo value to. This is in addition to any `trafo` of `Domain` objects given in `...`, and will be run *after* transformations of individual parameters were performed.
`.allow_dangling_dependencies`	(`logical`) Whether dependencies depending on parameters that are not present should be allowed. A parameter `x` having `depends = y == 0` if `y` is not present in the `ps()` call would usually throw an error, but if dangling dependencies are allowed, the dependency is added regardless. This is usually a bad idea and mainly for internal use. Dependencies between `ParamSet`s when using `to_tune()` can be realized using this.

Value

A `ParamSet` object.

See Also

Other ParamSet construction helpers: `Domain`, `to_tune()`

Examples

```
pars = ps(
  a = p_int(0, 10),
  b = p_int(upper = 20),
  c = p_dbl(),
```

```
  e = p_fct(letters[1:3]),
  f = p_uty(custom_check = checkmate::check_function)
)
print(pars)

pars = ps(
  a = p_dbl(0, 1, trafo = exp),
  b = p_dbl(0, 1, trafo = exp),
  .extra_trafo = function(x, ps) {
    x$c <- x$a + x$b
    x
  }
)

# See how the addition happens after exp()ing:
pars$trafo(list(a = 0, b = 0))

pars$values = list(
  a = to_tune(ps(x = p_int(0, 1),
    .extra_trafo = function(x, param_set) list(a = x$x)
  )),
  # make 'y' depend on 'x', but they are defined in different ParamSets
  # Therefore we need to allow dangling dependencies here.
  b = to_tune(ps(y = p_int(0, 1, depends = x == 1),
    .extra_trafo = function(x, param_set) list(b = x$y),
    .allow_dangling_dependencies = TRUE
  ))
)

pars$search_space()
```

`Sampler` *Sampler Class*

Description

This is the abstract base class for sampling objects like Sampler1D, SamplerHierarchical or SamplerJointIndep.

Public fields

`param_set` (ParamSet)
Domain / support of the distribution we want to sample from.

Methods

Public methods:

- `Sampler$new()`
- `Sampler$sample()`

- Sampler$format()
- Sampler$print()
- Sampler$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Note that this object is typically constructed via derived classes, e.g., Sampler1D.

Usage:

```
Sampler$new(param_set)
```

Arguments:

`param_set` (ParamSet)
: Domain / support of the distribution we want to sample from. ParamSet is cloned on construction.

Method `sample()`**:** Sample `n` values from the distribution.

Usage:

```
Sampler$sample(n)
```

Arguments:

`n` (`integer(1)`).

Returns: Design.

Method `format()`**:** Helper for print outputs.

Usage:

```
Sampler$format()
```

Method `print()`**:** Printer.

Usage:

```
Sampler$print(...)
```

Arguments:

`...` (ignored).

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Sampler$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Sampler: Sampler1DCateg, Sampler1DNormal, Sampler1DRfun, Sampler1DUnif, Sampler1D, SamplerHierarchical, SamplerJointIndep, SamplerUnif

Sampler1D *Sampler1D Class*

Description

1D sampler, abstract base class for Sampler like Sampler1DUnif, Sampler1DRfun, Sampler1DCateg and Sampler1DNormal.

Super class

`paradox::Sampler` -> `Sampler1D`

Active bindings

`param` (Param)
Returns the one Parameter that is sampled from.

Methods

Public methods:

- `Sampler1D$new()`
- `Sampler1D$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Note that this object is typically constructed via derived classes, e.g., Sampler1DUnif.

Usage:

```
Sampler1D$new(param)
```

Arguments:

`param` (Param)
Domain / support of the distribution we want to sample from.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Sampler1D$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Sampler: `Sampler1DCateg`, `Sampler1DNormal`, `Sampler1DRfun`, `Sampler1DUnif`, `SamplerHierarchical`, `SamplerJointIndep`, `SamplerUnif`, `Sampler`

`Sampler1DCateg` *Sampler1DCateg Class*

Description

Sampling from a discrete distribution, for a ParamFct or ParamLgl.

Super classes

`paradox::Sampler` -> `paradox::Sampler1D` -> `Sampler1DCateg`

Public fields

`prob` (`numeric()` | NULL)
Numeric vector of `param$nlevels` probabilities.

Methods

Public methods:

- `Sampler1DCateg$new()`
- `Sampler1DCateg$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
Sampler1DCateg$new(param, prob = NULL)
```

Arguments:

`param` (Param)
Domain / support of the distribution we want to sample from.

`prob` (`numeric()` | NULL)
Numeric vector of `param$nlevels` probabilities, which is uniform by default.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Sampler1DCateg$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Sampler: `Sampler1DNormal`, `Sampler1DRfun`, `Sampler1DUnif`, `Sampler1D`, `SamplerHierarchical`, `SamplerJointIndep`, `SamplerUnif`, `Sampler`

`Sampler1DNormal` *Sampler1DNormal Class*

Description

Normal sampling (potentially truncated) for ParamDbl.

Super classes

`paradox::Sampler` -> `paradox::Sampler1D` -> `paradox::Sampler1DRfun` -> `Sampler1DNormal`

Active bindings

`mean (numeric(1))`
: Mean parameter of the normal distribution.

`sd (numeric(1))`
: SD parameter of the normal distribution.

Methods

Public methods:

- `Sampler1DNormal$new()`
- `Sampler1DNormal$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
Sampler1DNormal$new(param, mean = NULL, sd = NULL)
```

Arguments:

`param` (Param)
: Domain / support of the distribution we want to sample from.

`mean (numeric(1))`
: Mean parameter of the normal distribution. Default is mean(c(param$lower, param$upper).

`sd (numeric(1))`
: SD parameter of the normal distribution. Default is `(param$upper -param$lower)/4`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Sampler1DNormal$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Sampler: `Sampler1DCateg`, `Sampler1DRfun`, `Sampler1DUnif`, `Sampler1D`, `SamplerHierarchical`, `SamplerJointIndep`, `SamplerUnif`, `Sampler`

Sampler1DRfun *Sampler1DRfun Class*

Description

Arbitrary sampling from 1D RNG functions from R.

Super classes

`paradox::Sampler` -> `paradox::Sampler1D` -> `Sampler1DRfun`

Public fields

`rfun` (function())
Random number generator function.

`trunc` (`logical(1)`)
`TRUE` enables naive rejection sampling, so we stay inside of [lower, upper].

Methods

Public methods:

- `Sampler1DRfun$new()`
- `Sampler1DRfun$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
Sampler1DRfun$new(param, rfun, trunc = TRUE)
```

Arguments:

`param` (Param)
Domain / support of the distribution we want to sample from.

`rfun` (function())
Random number generator function, e.g. `rexp` to sample from exponential distribution.

`trunc` (`logical(1)`)
`TRUE` enables naive rejection sampling, so we stay inside of [lower, upper].

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Sampler1DRfun$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Sampler: `Sampler1DCateg`, `Sampler1DNormal`, `Sampler1DUnif`, `Sampler1D`, `SamplerHierarchical`, `SamplerJointIndep`, `SamplerUnif`, `Sampler`

Sampler1DUnif *Sampler1DUnif Class*

Description

Uniform random sampler for arbitrary (bounded) parameters.

Super classes

paradox::Sampler -> paradox::Sampler1D -> Sampler1DUnif

Methods

Public methods:

- Sampler1DUnif$new()
- Sampler1DUnif$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
Sampler1DUnif$new(param)
```

Arguments:

`param` (Param)
Domain / support of the distribution we want to sample from.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Sampler1DUnif$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Sampler: Sampler1DCateg, Sampler1DNormal, Sampler1DRfun, Sampler1D, SamplerHierarchical, SamplerJointIndep, SamplerUnif, Sampler

SamplerHierarchical *SamplerHierarchical Class*

Description

Hierarchical sampling for arbitrary param sets with dependencies, where the user specifies 1D samplers per param. Dependencies are topologically sorted, parameters are then sampled in topological order, and if dependencies do not hold, values are set to NA in the resulting data.table.

Super class

paradox::Sampler -> SamplerHierarchical

Public fields

samplers (list())
: List of Sampler1D objects that gives a Sampler for each Param in the param_set.

Methods

Public methods:

- SamplerHierarchical$new()
- SamplerHierarchical$clone()

Method new(): Creates a new instance of this R6 class.

Usage:

```
SamplerHierarchical$new(param_set, samplers)
```

Arguments:

param_set (ParamSet)
: Domain / support of the distribution we want to sample from. ParamSet is cloned on construction.

samplers (list())
: List of Sampler1D objects that gives a Sampler for each Param in the param_set.

Method clone(): The objects of this class are cloneable with this method.

Usage:

```
SamplerHierarchical$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

See Also

Other Sampler: Sampler1DCateg, Sampler1DNormal, Sampler1DRfun, Sampler1DUnif, Sampler1D, SamplerJointIndep, SamplerUnif, Sampler

SamplerJointIndep *SamplerJointIndep Class*

Description

Create joint, independent sampler out of multiple other samplers.

Super class

`paradox::Sampler` -> `SamplerJointIndep`

Public fields

`samplers (list())`
List of Sampler objects.

Methods

Public methods:

- `SamplerJointIndep$new()`
- `SamplerJointIndep$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
SamplerJointIndep$new(samplers)
```

Arguments:

`samplers (list())`
List of Sampler objects.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
SamplerJointIndep$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Sampler: `Sampler1DCateg`, `Sampler1DNormal`, `Sampler1DRfun`, `Sampler1DUnif`, `Sampler1D`, `SamplerHierarchical`, `SamplerUnif`, `Sampler`

SamplerUnif *SamplerUnif Class*

Description

Uniform random sampling for an arbitrary (bounded) ParamSet. Constructs 1 uniform sampler per Param, then passes them to SamplerHierarchical. Hence, also works for ParamSets sets with dependencies.

Super classes

`paradox::Sampler` -> `paradox::SamplerHierarchical` -> `SamplerUnif`

Methods

Public methods:

- `SamplerUnif$new()`
- `SamplerUnif$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
SamplerUnif$new(param_set)
```

Arguments:

`param_set` (ParamSet)
Domain / support of the distribution we want to sample from. ParamSet is cloned on construction.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
SamplerUnif$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Sampler: `Sampler1DCateg`, `Sampler1DNormal`, `Sampler1DRfun`, `Sampler1DUnif`, `Sampler1D`, `SamplerHierarchical`, `SamplerJointIndep`, `Sampler`

to_tune *Indicate that a Parameter Value should be Tuned*

Description

`to_tune()` creates a `TuneToken` object which can be assigned to the $values slot of a `ParamSet` as an alternative to a concrete value. This indicates that the value is not given directly but should be tuned using **bbotk** or **mlr3tuning**. If the thus parameterized object is invoked directly, without being wrapped by or given to a tuner, it will give an error.

The tuning range `ParamSet` that is constructed from the `TuneToken` values in a `ParamSet`'s $values slot can be accessed through the `ParamSet$search_space()` method. This is done automatically by tuners if no tuning range is given, but it is also possible to access the $search_space() method, modify it further, and give the modified `ParamSet` to a tuning function (or do anything else with it, nobody is judging you).

A `TuneToken` represents the range over which the parameter whose $values slot it occupies should be tuned over. It can be constructed via the `to_tune()` function in one of several ways:

- `to_tune()`: Indicates a parameter should be tuned over its entire range. Only applies to finite parameters (i.e. discrete or bounded numeric parameters)
- `to_tune(lower, upper, logscale)`: Indicates a numeric parameter should be tuned in the inclusive interval spanning `lower` to `upper`, possibly on a log scale if `logscale` is se to `TRUE`. All parameters are optional, and the parameter's own lower / upper bounds are used without log scale, by default. Depending on the parameter, integer (if it is a `ParamInt`) or real values (if it is a `ParamDbl`) are used.
  `lower`, `upper`, and `logscale` can be given by position, except when only one of them is given, in which case it must be named to disambiguate from the following cases.
  When `logscale` is `TRUE`, then a `trafo` is generated automatically that transforms to the given bounds. The bounds are log()'d pre-trafo (see examples). See the `logscale` argument of `Domain` functions for more info.
  Note that "logscale" is *not* inherited from the `Param` that the `TuneToken` belongs to! Defining a parameter with p_dbl(... logscale = TRUE) will *not* automatically give the `to_tune()` assigned to it log-scale.
- `to_tune(levels)`: Indicates a parameter should be tuned through the given discrete values. `levels` can be any named or unnamed atomic vector or list (although in the unnamed case it must be possible to construct a corresponding `character` vector with distinct values using `as.character`).
- to_tune(<Domain>): The given `Domain` object (constructed e.g. with `p_int()` or `p_fct()`) indicates the range which should be tuned over. The supplied `trafo` function is used for parameter transformation.
- to_tune(<Param>): The given `Param` object indicates the range which should be tuned over.
- to_tune(<ParamSet>): The given `ParamSet` is used to tune over a single `Param`. This is useful for cases where a single evaluation-time parameter value (e.g. `ParamUty`) is constructed from multiple tuner-visible parameters (which may not be `ParamUty`). The supplied `ParamSet` should always contain a $trafo function, which must always return a `list` with a single entry.

The TuneToken object's internals are subject to change and should not be relied upon. TuneToken objects should only be constructed via to_tune(), and should only be used by giving them to $values of a ParamSet.

Usage

```
to_tune(...)
```

Arguments

...	if given, restricts the range to be tuning over, as described above.

Value

A TuneToken object.

See Also

Other ParamSet construction helpers: Domain, ps()

Examples

```
params = ParamSet$new(list(
  ParamInt$new("int", 0, 10),
  ParamInt$new("int_unbounded"),
  ParamDbl$new("dbl", 0, 10),
  ParamDbl$new("dbl_unbounded"),
  ParamDbl$new("dbl_bounded_below", lower = 1),
  ParamFct$new("fct", c("a", "b", "c")),
  ParamUty$new("uty1"),
  ParamUty$new("uty2"),
  ParamUty$new("uty3"),
  ParamUty$new("uty4"),
  ParamUty$new("uty5")
))

params$values = list(

  # tune over entire range of `int`, 0..10:
  int = to_tune(),

  # tune over 2..7:
  int_unbounded = to_tune(2, 7),

  # tune on a log scale in range 1..10;
  # recognize upper bound of 10 automatically, but restrict lower bound to 1:
  dbl = to_tune(lower = 1, logscale = TRUE),
  ## This is equivalent to the following:
  # dbl = to_tune(p_dbl(log(1), log(10), trafo = exp)),

  # nothing keeps us from tuning a dbl over integer values
  dbl_unbounded = to_tune(p_int(1, 10)),
```

```
  # tune over values "a" and "b" only
  fct = to_tune(c("a", "b")),

  # tune over integers 2..8.
  # ParamUty needs type information in form of p_xxx() in to_tune.
  uty1 = to_tune(p_int(2, 8)),

  # tune uty2 like a factor, trying 1, 10, and 100:
  uty2 = to_tune(c(1, 10, 100)),

  # tune uty3 like a factor. The factor levels are the names of the list
  # ("exp", "square"), but the trafo will generate the values from the list.
  # This way you can tune an objective that has function-valued inputs.
  uty3 = to_tune(list(exp = exp, square = function(x) x^2)),

  # tune through multiple parameters. When doing this, the ParamSet in tune()
  # must have the trafo that generates a list with one element and the right
  # name:
  uty4 = to_tune(ps(
    base = p_dbl(0, 1),
    exp = p_int(0, 3),
    .extra_trafo = function(x, param_set) {
      list(uty4 = x$base ^ x$exp)
    }
  )),

  # not all values need to be tuned!
  uty5 = 100
)

print(params$values)

print(params$search_space())

# Change `$values` directly and generate new `$search_space()` to play around
params$values$uty3 = 8
params$values$uty2 = to_tune(c(2, 4, 8))

print(params$search_space())

# Notice how `logscale` applies `log()` to lower and upper bound pre-trafo:
params = ParamSet$new(list(ParamDbl$new("x")))

params$values$x = to_tune(1, 100, logscale = TRUE)

print(params$search_space())

grid = generate_design_grid(params$search_space(), 3)

# The grid is equidistant within log-bounds pre-trafo:
print(grid)
```

```
# But the values are on a log scale scale with desired bounds after trafo:
print(grid$transpose())
```

`transpose` *transpose*

Description

Converts data.table::data.table into a list of lists of points, possibly removes `NA` entries of inactive parameter values due to unsatisfied dependencies, and possibly calls the `trafo` function of the ParamSet.

Usage

```
transpose(data, ps = NULL, filter_na = TRUE, trafo = TRUE)
```

Arguments

`data`	(data.table::data.table) Rows are points and columns are parameters.
`ps`	(ParamSet) If `trafo` = `TRUE`, used to call trafo function.
`filter_na`	(`logical(1)`) Should `NA` entries of inactive parameter values be removed due to unsatisfied dependencies?
`trafo`	(`logical(1)`) Should the `trafo` function of the ParamSet be called?
